I am planning a setup quite like yours. I've already built a VCO,
phase-shifter and mixers. What remains is the RF front-end and the
LF filtering and amplifying. I have just started playing a bit with
the ezkit.
I was thinking of letting the dsp also control the gain of the RF-
stage, to make an AGC.

> I can do a SSB receiver by performing a Hilbert transform (a 90

> can be recovered with this technique.

With this approach, you shift the original signal to 300 - 3000 Hz. You
probably have some analog lowpass filtering around 3 kHz in both channels.
A problem arises when there is a very strong signal on a nearby frequency,
and the dynamic range of the ADC (70 dB for the AD1847) is insufficient.

A better approach would be to shift the signal to -1350 - 1350 Hz.
You can then put analog lowpass filters at 1350 Hz in both channels.
Inside the DSP, two 90 degrees out of phase LO's at 1650 Hz and two
mixers are needed.
This is essentially a third-method (or Weaver) receiver.

Another advantage of this setup is that the first LO doesn't have to
be on the precise frequency of the suppressed carrier, because you can
easily tune the second LO. This enables the use of a PLL'ed first LO
with tunig steps of for instance 1 kHz.
This would require a 500 Hz higher cut-off for the analog lowpass filter.

The low-frequency response of the codec might be a problem, since it
results in a gap in the middle of the signal. I will probably modify

the input-network on the ezkit and hope that the ADC itself doesn't
have too much filtering. A gap of about 10 Hz or so can be realized with
5 Hz high-pass filters and would probably not distort the signal too
much.

> And conversely, I can generate any arbitrary modulation by
> supplying suitably processed I and Q signals to a pair of

> I and Q to the mixers. By playing a suitably processed
> stereo WAV file through the sound card, I can synthesize
> any M-ary coding scheme on the RF channel.

Why don't you also use the dsp for modulation? Only some LF switching
is needed.

> This setup is very cheap, and requires few parts. It is a good

Hi

I have just finished my NEW home page. There is a french and a english version and I hope a German version will come as soon as possible. you will find there a lot of infos about packet radio and a link of ham rado home pages where you can register your own home page. So i invite you to have a look at my new URl:

http://www.mygale.org/11/fa1ukp

All my best 73's and happy new year.

Anyone out there have a very cheap tnc for sale.
We are trying to setup a small packet station here to get the
local kids interested in ham radio. Not having much luck as of
yet though. So far all we have been able to scrape up is an
antenna,feedline, and 2 dumb terminals. We also need a 2 mtr rig
and power supply. If anyone has any of this at a reasonable price
please let me know. Leave a follow up here or e-mail to the address
below........
Thanks;
WS3O

I think the best idea for you would be to consider the Hal
Communications model P38 PC plug in board. It will operate a very good
weak HF signal mode called clover. It also works PACTOR, AMTOR, RTTY,
and ASCII modes all in one. The board is easily upgraded by simply
visiting Hal's homepage and downloading their latest firmware upgrades.
The web address for them is http://www.halcomm.com. The price for the
P38 is only $299 while the sales event remains and is a very good
price. Then if you do get clover operating, come visit us all on
14.065.5 Mhz Lower side band!

> W3LD
> rhaire@epix.net
> ï¿½*
There's already been an answer to this, but let me elaborate on it
a bit:

The RS-232 is a "single-ended" transmission scheme. That is, the
transmitted signal is referenced against ground. It's your basic
"unbalanced" transmission line. (Other protocols, such as RS-422 are
"balanced"; that is, they use a pair of wires, and the signals on each
wire are always in opposition to each other. But I digress...)

Because it's single-ended, the RS-232 standard (now actually EIA232,
such as it is) defines two 'ends', one that transmits on that pin, and
the other that receives.

One end is called the DTE, for Data Transmission Equipment. The other
is the DCE for Data Communications Equipment. One will transmit on a
pin, the other receive.

For instance, Pin 2 is Transmit Data. The DTE is defined as
transmitting on Pin 2; the DCE receives on Pin 2 (even though the
signal name is still Transmit Data). Confusing, huh?

Pin 3 is Receive Data. The DTE receives on Pin 3, the DCE transmits on
it.

Pin 7 is ground, and both sides agree on that :-)

The RS-232 control signal names can be confusing without a little
bit of background. Now that you know that a terminal was defined
as a DTE, it makes sense that DTR (Data Terminal Ready) would be
transmitted from a DTE. Likewise, if you know that the early name
for a modem was a data set, it's understandable that DSR (Data Set
Ready) would be transmitted on from a DTE.

It's all very confusing, but it's easy to keep straight if you
just remember:

A D<T>E <T>ransmits on <T>wo.
Everything else falls into place

Back when they were defined, terminals were DTE's and modems were DCE's, and that's all there was to it, and it was simple. With the advent of other RS-232 devices that were neither terminals nor modems (printers, plotters, you name it), the manufacture generally flipped a coin to decide if the product should be configured as a DTE or a DCE (some were strap configurable).

The bottom line way to find out: measure the voltage on Pin 2 against Pin 7; If there's more than a few hundred millivolts on it, it's <T>ransmitting on Pin <T>wo, and therefore must be a D<T>E.

As far as the physical connectors go, up until the advent of the PC AT, RS-232 was always carried on DB-25 connectors. But there was no general consensus on whether a DTE should be male or female, so that's why companies have gotten rich making RS-232 (DB-25) sex changers :-) If you look carefully at the connector, the pins will be marked in the plastic. Pins 1 to 13 run across the wider row, with pins 12 through 25 on the narrower bottom row. (Whether they run left to right or right to left depends on whether you looking at a male connector or a female connector, and whether you're looking at the front or back of the connector!)

Sorry for the longish reply. Maybe this info will be helpful to some out there.

Hi Rodney,

I am sure you can still buy a manual from AEA. You can no longer reach them by phone but they do respond to FAXs. You can FAX them at (206) 775-2340. The cost of the manual from them is $25.00 and it will, of course, be the latest manual.

Bill

Consider keeping your PK-232 and adding a Timewave DSP-599zx in front
of it. Their model 59+ and 9+ also do a good job improving weak signal
digital communications.

>>I have the KPC3, which can be had for about $120 mail order or in a
>>local dealer. And MFJ sells a cable that is ready to plug in to the
>>HTX202. It's about $15.

And if you're handy with a soldering iron, here's the schematic for that
cable:

Here's the TNC hook up for the Radio Shack 2m HT:

```
TNC Radio
=== =====

Audio Out -----------||-------------- Tip of Mic plug
C1 |
|
PTT Line ----\/\/\/--------| Ring of Mic (not connected)
R1

Audio In --------------------------- Tip of speaker plug

Ground ---------------------------- Ring of Speaker plug
```

C1 is a 0.1 mfd capacitor of any type, R1 is 2200 ohms.

12. Need PK232-MBX Manual

Newsgroup: rec.radio.amateur.digital.misc

From: Rodney Isom <j.r.isom@ieee.org>
Message-ID: <01bbf7fe$f3bca140$e29b79a8@rodneyi.mindspring.com>
Source record: 32752

I bought a used PK232 TNC with the MBX upgrade already installed. It also has an upgrade that does PACTOR, WeatherFAX, AMTOR, and NAVTEX.

I have the original operating manual which includes chapters 1-6, along with what seems to be an addition to chapter 4 and a couple of loose pages that appear to be an additional table of contents for chapters 7-11 (covers AMTOR, PACTOR, NAVTEX, Morse, and FAX operation). However, I don't have the manual pages that go with these contents pages. I also don't have the manual to the MBX upgrade. I am willing to pay a reasonable amount for a copy of these manuals if anyone knows of a source from which I can get them.

Also, the battery holder has been removed from the TNC. I would like to replace it, but I don't know where the wires go. Any help would be appreciated.

13. Packet Protocol Error

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-01 00:00:00 UTC
From: Rick Cottle <n7zzd@sprintmail.com>
Message-ID: <32CAAEE2.3136@sprintmail.com>
Source record: 32753

I have a new Baycom packet modem, and it and the software seem to work. The problem I have is that the only things that work are the connect and disconnect requests. Once the BBS starts to send data (menus, etc.) to my station, my station sends a reject back to the BBS. This cycle continues repeatedly, and only rarely does my station acknowledge receiving the packets correctly.

I've tried playing with antenna locaiton, power, and other stuff, but to no avail. Any help is greatly appreciated. Please cc: my email.

73 and Happy New Year,

>the same first three parts is considered local.

The mask defines which bits are considered network and which ones are
host. Given an IP address such as 44.136.15.15 (class A block) with a
mask of 255.255.255.0, this dictates that:

255 255 255 0
11111111.11111111.11111111.00000000

00001110.10001000.00001111.00001111
44 136 15 15

gives you

00001110.10001000.00001111 as the network address
44 136 15

and 00001111 as your host bits, also known as a 24 bit netmask.
This is a common mask used in class B networks where non-variable
netmasks are used, such as RIP implementations which give you a
standard class C block. The remaining eight bits, or host bits can be
assigned to hosts on that given subnet. This will give you a possible

255 hosts, minus address 0 (network) and 255 (broadcast), or 253 hosts.

I should note that the fixed network address is assigned by the Internic, in this case being a class A address, the 44. Whomever administers the 44 net can define network bits anywhere to the right of the first octet, done by the netmask. Of course class Bs are assigned the first two octets, and class Cs are the first three. There is a class D and E, but I haven't seen them used.

Should you use a mask such as 255.255.255.252, this would give you two possible hosts per network, popular in networks using serial links between routers before the time of unnumbered IP. As follows:

11111111.11111111.11111111.11111100
255 255 255 252

00001110.10001000.00001111.00001111
44 136 15 15

This mask allows for only the last two bits to be host bits. If the network planner wanted to base his network on a maximum scope of the eight bit host, this could be implemented as such:

Network 44.136.15.0 would be NETWORK 0 with valid addresses of 44.136.15.1 and 44.136.15.2. 0 would be NETWORK and 3 would be your broadcast address.

Network 44.136.15.4 would be NETWORK 4 with valid addresses of 44.136.15.5 and 44.136.15.6. 4 would be NETWORK and 7 would be your broadcast address.

And so on and so on ....

I hope this very brief discription makes some sense.

Ed

It seems that everybody has gone to the internet around here also. I run the local BBS and had to alert the node op (who hasn't been on packet for a long time) that his node needed maintance. They funny thing is that ALL of MINNESOTA has been cut off from the internet more then once. It is a shame, I try my best to encourage and assist others with BBS's and NODES, even maintain my own node, but time is so limited for me.

I don't know what more to do. Any Ideas? We HAVE to come up with some. As dead as VHF, UHF are around here I really don't blame other services for looking at our spectrum. My business frequency has 15 peope within 50 miles using it and all I hear on the local repeaters are just the CW id. [SIGH] Just one repeater pair could provide for 30 users or even more if they used DPL codes.

>Same thing around here. The big guns who ran the digi/nodes have all

19. Designing software-based costas loops...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-02 00:00:00 UTC
From: "George F. Santamarina" <gsanta@mindspring.com>
Message-ID: <32CC33A0.33A7@mindspring.com>
Source record: 32617
Cross-posted to: comp.dsp,rec.radio.amateur.digital.misc

Are there any good books on software implementation of
Costas loops?

I want to use a costas loop to regenerate the suppressed
carrier for an MSK signal and thus be able to synchronize
the receiver. Supposedly, the I-filter arm of the loop
will recreate the suppressed carrier.

TIA,

-George
gsanta@mindspring.com

20. AEA DSP-232

Newsgroup: rec.radio.amateur.digital.misc

From: hal_hazel-oao@imdgw.chinalake.navy.mil
Message-ID: <hal_hazel-oao-ya023180000201971144100001@news.nrl.navy.mil>
Source record: 32618

Hi and TIA:

I realize AEA is going/gone out of business and there is no guarantee that whoever picks up their TNC line is going to offer any assistance on AEA models, however.....

How was/is the DSP-232? I've read that there were some problems with working satellites with it, but for normal 1200/9600 terrestrial work and the HF modes, it worked fine. Is this true?

I have an HK-232 that has worked fine since day-one. Heathkit is not around that I know of, but I'd still buy their product. I'm thinking just because AEA is no longer around doesn't mean their products are no good. If the DSP-232 works, and I find a good deal, why not? Besides, I would imagine there'll probably be an AEA TNC Users Newsgroup added soon to provide support. HI HI

Source record: 32619

I've had a 232 for many years. When they first came out they had a battery holder that used alkaline batteries, but they subsequently switched over to a lithium battery when they upgraded the system to "PAKMAIL". Look on the PC board to see if there is a lithium battery soldered to the board. Good luck on the manual--I bought one to replace my VERY old version just a couple of months ago and it was worth the $25.

I'm kind of in the same quandry right now. It is frustrating when someone calls me back on PACTOR and my TNC can't pull him out of the mud. Arrrh.

I don't know which way to go. Personally, I would like to get into DSP programming. So, that makes the DSP93 attractive. But, then I'm lusting after that last little molecule of performance.

I'm tempted to wait on this as my guess is that we're on the downward price curve DSP wise. And save up instead for a new scope and 440Mhz beam/transverter.

This is absolutely an eye-opener for me. While I'm not one to stand in the way of technology (I have a $19.95 internet account, as well as free e-mail via JUNO)...I'm astounded that the packet network appears to be falling apart in other parts of the country. I'm especially surprised that it's going to pieces in those areas that had superior networks to what ee have in FL.

Here in FL, there is still a fairly good 1200 baud network (yes, it would be nice to have 9600 baud links statewide, but there never seems to be enough money, and USERS (myself included) find it hard to justify the expense of a 9600 baud packet modem, considering the limited content of messages on the packet network (for sale/want/help/need etc.)

Having said all that, it does NOT surprise me that packet BBS's are still around. They are a reliable, CHEAP way of shuttling data around the world...and a ham can run an automated program (like TSTHOST, which I use) on a minimal PC and gather up a handful of interesting bulletins every day for almost no cost at all!

(Yep, hams are cheap...myself included. One of the challenges I like is to see "how much I can do with how little"). At the risk of tooting my own horn a bit...this message is being entered on a 1985 full size IBM AT with 640K, 20 and 30 meg hard drives/vga monitor. The software (Nettamer) provides full FTP-USENET-TELNET-E-mail access via a ppp account. The PC also runs TSTHOST...which blows the doors off of TPK and T4.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I had WISP running fine with a PK96 TNC set as a TNC-2. I recently got a 9600 baud card for my PK900 TNC, and when I set it up to run in place of the PK96, NOTHING worked. I reset the TNC type to PK900, and even with strong signals, nothing appears on MSPE. I reset the TNC type to TNC-2, with non improvement. Does anyone here have a PK900 running with WISP?

WHAT AM I DOING WRONG?

Unless you are technically challenged , get a TNC2 clone. There are a number of them for less than $120US. If you have any intent or ability to upgrade your own equipment say away from kantronics. KPC-3's and other cheep kantronics boxes can not be upgraded with external modems or third party firmware.

On the other hand if building the cable from the rig to the tnc seems difficult better just spend as much as you can and get 9.6K ready tnc. In this case kantronics makes a good one....

I've been thinking about the same approach, Gary, but have been concerned about the LO phase shift networks. I've been considering first converting to some loosely Xtal filtered IF first. That enables me to do the I/Q generation at a single frequency and, in concept, get better phase accuracy. If I use some of the new AD DDS's I don't need much in the way of LO generation circuitry. Have you considered this or do you think the LO phase shift network is easy and generating only one LO is a better trade?

For sale:

1. Icom IC-2GAT 2 meter HT. This HT is about 5 years old. Is in good condition, with some blemishes on the rear of it in the vicinity of the belt clip. Comes with two batteries, the stock one for 7 watts out, and a higher capacity BP-8. Also comes with the adaptor unit that will allow it to be powered from an external 12 volt source (which is not included). With original antenna and battery charger. Asking $175.00 for this package, plus shipping.

2. Kantronics KPC-3 TNC, about three years old. Has 128k ram chip in it for large size mailbox. Top part of case has two holes drilled in it, as TNC was mounted underneath a shelf. Otherwise in excellent condition. With manual. Asking $75.00 plus shipping.

Will sell both as a package for $225.00 plus shipping. This includes custom made cable for Icom HT to KPC-3. Great for portable packet application, just add laptop!

Will ship UPS COD only, cash or money order.

Thanks for reading.

I think we, collectively, have enough experience to build a very very
good PC based DSP TNC. We can use a sound blaster board, we cheap PC, and
use of of the COM ports to make it look like a off the self TNC. This
way, it will work with other TNC software such as PacRatt or KaWin.

The PC configuration would look something like this:

- Sound Blaster DSP card
- 4 Megs of RAM
- Floppy drive
- One Serial Port

I would like to see it support HF Modes (RTTY, ASCII, AMTOR, PACTOR),
SSTV, FAX, VHF Packet, and also the satellite modes like BPSK.

Unfortunatly, I don't have that much DSP experience to do this or I would
have done it already.

If anyone is interested, lets start the project! I think it could turn
out to be very fun.

I'm willing to start a mailing list on my machine to kick of the discussions.

Thanks,
Kory

For my experimental purposes, having step adjustable manual gain is
an advantage since I don't have to worry about interactions fouling
up my measurements of weak signal performance. For general use,
letting the DSP generate an AGC signal sounds like a good idea, but
I am somewhat concerned that the delay through the DSP might allow
large AGC overshoots.

This is interesting. I don't know much about the Weaver method.
Can it be used for other arbitrary signal forms such as PSK, or
M-ary constellations? I know how to do that with my setup, but I
don't know what the additional level of indirection would imply for
these waveforms.

>> And conversely, I can generate any arbitrary modulation by

>Why don't you also use the dsp for modulation? Only some LF switching
>is needed.

Yeah, but then I wouldn't have the receiver available to monitor my
own transmissions. For my experimental purposes, having separate
transmitter and receiver is an advantage. For general use, making
the system a transceiver would make sense (reduced parts count).

>I thought the P3D power output and antenna gain is high enough to
>allow the use of omni antennas on the ground. Is this not true?

P3D will have more power, but from what I understand that power will
be used to have more than one mode active at the same time, IE the
power will be spread over more bandwidth. So you'll still need at
least a minimum Oscar 10 class receiving station for most activities
near apogee. At perigee it should kick butt, but it will spend a lot
more time out toward apogee so you should plan your station accordingly.

One big advantage will be the 3-axis stablization it will use.
That means the gain antennas will always be nadir pointing.
The problems we had with O10 and O13 due to poor squint angles
should be gone. It won't have to switch to its omni antennas at
perigee. And spin modulation shouldn't be an issue either. This
will lessen Earth station requirements somewhat. I don't know
if omni antennas will suffice, though. The receivers on P3D
won't be any better than those on O13, so you'll still need a
fair amount of uplink ERP even with gain antennas on the satellite.
I suppose you could use an amp into an omni, but it seems to me to
be better to use steerable beams for both up and down links.

The pros are the obvious freedom of a cordless headset.

The cons are great, in my opinion.

1)You can be listened to by other cordless phones, scanners, baby monitors and other devices. This results in no privacy.

2) If you live in an appartment or densely populated community, you can hear other handsets or headsets using the same frequency or channel you are on.

3) The batteries in the cordless unit can die with little or no notice. Nicad batteries have a fast "drop-off" and the time spent off the charger is limited.

4) In some cases other handsets or headsets can capture your base unit's dial tone and dial out on your line. This problem has been resolved with the newer models using security codes.

These problems become more evident in apartment dwellings where the chances of other having a cordless close to yours is strong.

I hope this helps you with your concerns.

Rich

> others with BBS's and NODES, even maintain my own node, but time
> is so limited for me.
> If what you say is true, (but I dont know if it is that way in our area since I completely dropped out of packet several years ago), I would figure that things have peaked and dropped off as things became obsolete for many. A few of us who tried to get some activity going a number of years ago for "high" speed 9,600 baud packet got nowhere with the entrenched bbs op and his friends who opposed any new ideas and were particularly resistant to tying the internet to packet to make packet a fantastically useful message system for a lot of folks.

Those of us who realized what could happen were made to understand that our ideas were not welcome. And even when I made a presentation at a small regional meeting about 9k6 and internet connectivity and new directions, most members felt that this was too expensive for them and the power structure asked me to never bring up heresy like this. They opposed ARRL QST articles and certainly TAPR on any of these new directions. So now I have my "radio" on the internet which takes up 90% of my operating time and I bet a few other folks are in the same situation. And I am actually enjoying it more.

Hello,

I'm looking for an inexpensive, moderate to good quality, wideband 137MHz receiver for wefax, used or new. Also, any other related equipment for this (hobby for me) such as pre amps, antennas, dishes (4 to 6 ft.), software, etc. Primarily interested in used gear but recommendations on the best of the new gear appreciated. Anyone have any recommendations or anything for sale?

Thanks for your help. BTW.. I do have Dr. Ralph E. Taggart's book on Weather satellites.

Does anyone have the schematics to connect my TNC to my motorola HT?
I've got a AP50, it's pinout is 100% identical to their Radius GP300.

42. ### Homebrew TNC?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-03 00:00:00 UTC
From: 9v1zy@amsat.org
Message-ID: <32ccd6a8.3100242@news.pacific.net.sg>
Source record: 32640

I'd like to homebrew a TNC, does anyone have any pointers on where I
may start?

Basically I've got access to several 8088 chips and a 68HC11 which I
was thinking of putting into use. Perhaps build some sort of small
interface between my PC & my baycom modem.

Was thinking along the lines of a TNC capable of doing KISS.

Email responses appericiated. Thanks.

WRT the win95 dos window. I have been having trouble getting
my baypac to work. I have been doing the Shutdown/Restart in
DOS mode assuming this is really just like DOS, and not
multitasking or anything. The setup seems to receive ok,
but I cannot successfully connect. Sometimes the ax.25
connects, but any text from the other station results in my
station sending bunches of rejects.

Any advice?

> one of those "it looks good in theory" ideas).

I've been thinking about the divider technique too but that means DC
must be one band or use pre-mixer filters to reject odd harmonics of the
LO, right? I was thinking about a 2-30 MHz upconversion to 70 MHz and
using an RF Micro Devices RF2711 which has the dividers on the device -
the phase _guarantee_ is pretty bad but it should actually turn out good
I would think.

Do you know anything about these RFMD parts?
How about AD831 mixers?

A one band rig would certainly be best DC but multiband would make me
lean toward SuperHet. I could just build a bunch of single band
"front-ends" _but_ I could also use the 70MHz IF for VHF/UHF stuff _but_
now I can get 2+ GHz parts to do a 1296 DC _but_ ....

All of this is still in the thought process for me. I'm just getting
active again and am interested as much in the technology as the
operation. I "used to be a double-E" but now I'm a software/marketing
guy. Every so "hardware mania" comes over me and that's happening now.
:-)

I'd be interested in carrying this on point-to-point.

hello from Jim in Atlanta. All previous points correct,I've got some
experience with those too. I have found that the 900 mhz that use
spreadspectrum encryption work real well. You can be on hf running a k
with no rfi. The range is great,has the same charecteristics as our band
close by. Can be monitored,but they have to work for it! In my opinion
worth the expense. Good Luck KD4CDB

50. C code for HF WEFAX demodulation

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-04 00:00:00 UTC
From: please.post.replies
Message-ID: <5akpcf$3e8@moe.relay.net>
Source record: 32644

I've been tinkering with some C code I wrote to
demodulate HF WEFAX transmissions from sounds digitized
through my PAS-16 sound card. The OS I'm using is Linux.
I'm to the point where I have the code spewing frequencies
based on averages of some number of half-cycles, based on
interpolated zero crossings. The sampling rate I'm using
is 27117 sps/8 bits - fast as the PAS-16 will reliably run
in my system. The frequencies output jitter more than I'd
like, even on a pure tone input but I'm getting there!

Wondering - has anyone else already done this, i.e.,
written portable C code to demodulate WEFAX transmissions?

In case I'm needlessly reinventing the wheel doing this... :)

Please post replies. The email address in the header is
invalid 'cause I don't like spam in my mailbox.

73,

Dave WB9TMF

>14.065.5 Mhz Lower side band!

The only good thing on the P38 is its price.
The unit has not enough processor power and has low performance.
(see QST,I believe december). Its Pactor I mode and amtor mode is
rather poor compared to a number of other units.
If you really want clover I would consider one of the more expensive
HAL units. But for the same price you can buy optimum Pactor I and
Pactor II mode. look atSCS (http://www.scs-ptc.com/)
Again see QST.

55. Dec QST

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-04 00:00:00 UTC
From: Curt Dunn <cdunn@netsync.net>
Message-ID: <32CEA6BC.10B3@netsync.net>
Source record: 32649

Thanks for reading:

Due to QST being buried in a snowbank,was wondering where I can
get the article or one explaining linking Internet Phone and
repeaters,and the required hardware??

Email would be appreciated.

I have seen some threads on the baycom ith headers stating there is a question but none in the text. I have been using the baycom and both a notebook and an HP200LX as the interface.
Jnos is not a problem either except in a Win95 DOSwindow.
Any questions again? QST will be posting an article on my experience in a few short months.

The KAM is a good unit and really the only US made HF TNC worth
buying at this time (unless you consider the Paccomm PTC-II, with German
made parts). You have the FT1000 and as long as you have the 500hz filter in
the Yaesu the KAM will perform fine. The big advantage is that the KAM gives
you all of the modes, dual port and the price is reasonable.

>What software, other than from Kantronics, is available for use with the
>KAM Plus?

Lots of program are out there for the KAM unit. If you search the WEB
you should be able to find quite a few listing for the KAM. You can
try the TAPR web page.

I write both Windows and DOS versions for the KAM unit. They can
be found at the WEB site below.

>
>What is the latest version of the KAM Plus firmware?

8.0

>What is a typical price for the KAM Plus?

Around 350 as I remember, but if I am wrong I am sure someone
will correct me...

I use the Kam Plus 8.0 and Gary's XPware software.
You won't go wrong. Only thing you won't have is Clover and there arn't many Clover stations
anyway. Gtor is quicker than Pactor but not so many ops either even though there are many Kams
out there.
Check out Gary's software. By far the best and NO ONE gives better support.

61. Re: Pin out 25 pin rs232

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-05 00:00:00 UTC
From: "Robert A. Recny" <rrecny@neo.lrun.com>
Message-ID: <01bbfa9b$e7ea7dc0$6fc6d2cc@recny.neo.lrun.com>
Source record: 32559

25 pin Signal 9 pin

2 TxD Transmit Data 3
3 RxD Receive Data 2
4 RTS Request To Send 7
5 CTS Clear To Send 8
6 DSR Data Set Ready 6
7 Sig Ground 5
8 DCD Carrier Detect 1
20 DTR Data Terminal Ready 4
22 RI Ring Indicator 9

This pinout is the most commonly used set of pins. All 25 pins are defined by the EIA-232 specification, but rarely used any more for most PC based ports. You might see more of them if you get into synchronous communications (i.e. a clock signal is transmitted in addition to data and control signals).

Both the 9 and 25 pin listings are assuming the DTE (Data Terminal Equipment) side. DTE devices are things like terminals, computer ports, printers, etc and typically use a male connector.

The other end is denoted DCE (Data Communication Equipment) and is used on such devices as modems and multiplexors. The pin assignments are swapped in the following "pairs"
TxD/RxD, RTS/CTS, DTR, DSR
RI and CD only go from DCE to DTE. A female connector is typically used.

If you want to connect two DTE devices (i.e. two computers), you must use a null modem cable or adapter which performs the appropriate pin swapping. A typical cable is made in the following fashion:

** 2 - 3 (TxD to RxD)
** 3 - 2 (RxD to TxD)
** 7 - 7 (Signal Ground)
4 - 5 (RTS to CTS)
5 - 4 (CTS to RTS)
20 - (6 and 8) (DTR to DSR and CD)
(6 and 8) - 20 (DSR and CD to DTR)

** Sometimes you can get away with just these three wires if the connection ignores the modem handshake lines.

I hope this helps.

>do you think the LO phase shift network is easy and generating only one
>LO is a better trade?

Well, Randy, I've "oscillated" all over the map about this. On
the one hand, a DDS with quadrature outputs is a simple and elegant
solution to the problem. On the other hand, a VXO driving a simple
lumped phase shift network is cheap, and adequate for some of my
experiments. And on the gripping hand, another approach is to divide
down a higher frequency LO to get quadrature outputs. The DBMs are
real happy with square wave drive.

I've resisted going superhet because I want to keep this simple
and clean, and because I want to experiment with some ultra-stable
coherent recovery techniques and I don't want another oscillator
in there with the inherent complications that would bring. I
expect I'll use the divide down technique for that (though we'll
have to see how much jitter I get in the dividers, this could be
one of those "it looks good in theory" ideas).

Achieving good quadrature is important. If it is only slightly
off, opposite sideband rejection drops dramatically. Right now
I just inject an opposite sideband signal while running SSB
code, and adjust the phase shift network for best null. Then
I'm ready to go. Within the tuning range of the VXO, that
is quite good enough.

Gary

Source record: 32566

Hello all,

I have a little problem that I hope someone out there can help me with.

Currently, for 1997, our club, the Society of Newfoundland Radio Amateurs is operating our VO1AA club station under the callsign VO500JC, in commemoration of the 500th anniversary of John Cabot's voyage to the New World. Located at the station is an old version (3.0 or so) of the KAM that I would like to be able to use on the digital modes. In trying to set it up, I ran into the problem that the TNC won't accept the callsign as the MYCall. It is one character too long.

What I would like to know is if it is possible to set up the TNC to accept it by some other means. If the newer firmware can handle it then that would be an easy fix but it would be nice to give the digital operators a chance to work the callsign.

Thanks in advance.

72. NEWBIE: Q advice about packet modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-05 00:00:00 UTC
From: aversa@linux0.unsl.edu.ar
Message-ID: <5aonl3$6af@linux0.unsl.edu.ar>
Source record: 32570

Hello,
I'm going to start experimenting with TCP/IP over packet radio. I'd like
to try KA9Q NOS with AX25DRV. Could you please advice me about which
packet modem should I buy? is the MFJ-2400 (~$27) suitable for the above
combination of software? Will any Bell 202 (FSK) modem work with the
AX25DRV? is 4-January-1993 the latest version of AX25DRV? Thanks in advance.
Best regards,

-fernando (aversa@unsl.edu.ar)

73. High Speed Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-05 00:00:00 UTC
From: Tom Hogevoll <hogevoll@erols.com>
Message-ID: <32CFF0E0.4733@erols.com>
Source record: 32571

Has anyone looked into ABACOM Technologies Radio Data Modules and possibly converting them for use on packet radio?

ABACOM has a transceiver module an with RS-232 data connection, RF at 418 to 433 MHz and supports a data rate anywhere from 4800 bps to 38,400 bps. RF output available is .25mW, 1mW, or 10mW. It would need to be amplified and reconfigured for the 70cm band. The module automatically handles T/R switching List price is $139.30.

If this thing can be converted for ham use it may bring renewed interest in packet communications. 1200bps is too slow and anything faster can get too expensive and thus unattractive to less than diehard packeteers.

>What is a typical price for the KAM Plus?
$300, from AES, last October

In addition to not having Clover, the KAM Plus also does not have the new
Pactor II. That's a brand new mode, reviewed in the January QST. Right
now, Pactor II is available only from SCS, for about a kilobuck, so for a
while, we won't miss it much. But the review said it was really speedy and
very robust in weak-signal conditions.

>9600 baud packet modem, considering the limited content of messages on the
>packet network (for sale/want/help/need etc.)

Well, the limited content may be the result of the slow network.
It's a matter of chicken and egg. People wanting to exchange larger
messages have simply given up using 1200 baud. And 1200 baud sysops
have been partly responsible for this by imposing message length
limits on their users. They've had to do this due to the slow
network, otherwise forwarding would require more time than is
available in the day.

>Having said all that, it does NOT surprise me that packet BBS's are still
>around. They are a reliable, CHEAP way of shuttling data around the
>world...and a ham can run an automated program (like TSTHOST, which I use)
>on a minimal PC and gather up a handful of interesting bulletins every day
>for almost no cost at all!

Well, it isn't cheap from the sysop point of view. If you look at the
total investment in the typical BBS station, the modems are a minute
fraction of the expense. The systems could be much more useful if the
network speed were increased. Much of the system investment is wasted
because the radio network limits its use.

>(Yep, hams are cheap...myself included. One of the challenges I like is to
>see "how much I can do with how little"). At the risk of tooting my own horn

>full FTP-USENET-TELNET-E-mail access via a ppp account. The PC also runs
>TSTHOST...which blows the doors off of TPK and T4.

Yeah, but what are you accomplishing *on the air*? Your setup could work with a faster network, but it doesn't because you won't spend a little bit on the radio side to make it happen. Is the cost really that big an impediment? I don't think so, I think that's just an excuse. I think that the real problem is that 9.6 kb isn't plug and play. People are frightened of it because they are afraid they won't be able to make it work.

There is some justification for that fear. 9.6 kb the way we do it does require modification of voice grade radios to make it work, and some amateur radios simply aren't suitable. But it is discouraging to think that *radio* amateurs are afraid to work on radios. That's what we're supposed to be about. And ironically, 9.6 kb is easiest on old cheap crystal controlled radios. Very often, those of us doing 9.6 kb and faster have less invested in *both* radio and modem than those doing 1200 baud have invested in their radio and modem.

Actually, the better next step up from 1200 baud is 19.2 kb direct FSK. This is very easy to do, and costs *less* than even a 1200 baud setup. Of course you have to do some *radio* work to make it happen.

Gary

You've put your finger on one of the two major reasons for packet
radio's stagnation and decline, and indeed the major reason for
amateur radio's stagnation and decline. The cost excuse is really a
red herring. The cost differential between any of the various speed
systems we have today is insignificant at the system level, and the
faster systems are actually cheaper per bit. It is fear of change,
or more properly, fear of failure to be able to adapt to change,
which is holding back faster packet and/or more advanced networking
methods.

Some of those running the current systems are afraid that they
will lose their guru status if things change. They are afraid
that they won't be able to understand the modulations or protocols

of better systems, and afraid that they'll have to open the covers of their radios, and fail to understand them as well. In short, they not only fear that their equipment will become obsolete, but that *they* will become obsolete.

This is a sad commentary on what has become of amateur radio, but it is pervasive throughout today's amateur radio. Every progressive change has been opposed by those fearing that they won't be able to adapt (they'll throw up smokescreens to hide behind, but this is the real motivation). This is entirely contrary to the true spirit of amateur radio. As the amateur's code says, "The amateur is progressive", but too few are today. Amateur radio is supposed to be a continuing learning experience, but too many amateurs want to rest on their laurels and freeze things at the level of *their* current expertise.

We should of course try to dispell these fears, show the opponents of change that they *can* understand the newer methods, sell them on the advantages of the newer ways. But if that fails, we must *go around* them. We must push on regardless of what the old guard wants to do. That's a hard road. It is especially a hard road in packet, which is inherently a cooperative enterprise. But it may be the only road we can take, unless we just throw up our hands and switch to the wired network and become dependent on commercial providers outside of our control for all our communications.

If we do that, it will spell the end of amateur radio as anything but a glorified CB service populated by *users* who have no desire to learn or improve how things work. The only constant in the world is change, and if we fail to evolve with those changes, or indeed if we fail to lead those changes, we are doomed to be sloughed off as vestigal and maladaptive parts of the communications world.

Besides, experimenting with new ideas is *fun*. It is Man at his creative best. It is an incredible rush to suddenly have a new insight burst forth in your awareness. It is a huge kick to see your idea come to life on the bench, to see it spread its wings and move out into the world. There's nothing else in the world like it.

>like, even on a pure tone input but I'm getting there!

This is a problem with zero crossing counters. Zero crossing
is often ill defined in the presence of noise, and can wander
with DC offsets. Zero crossing is also the point of minimum
energy for the signal. That's perhaps the *worst* time to
try to detect it.

A better approach is to differentiate the signal and count
the points where the *slope* is zero. This occurs at the wave
crests, the highest energy points, and gives considerably
better performance in noise. D'sin(x)=cos(x).

Low pass filter the signal before differentiating, of course,
so that sharp noise spikes won't corrupt the count. You can
also use noise coring on the signal before differentiating it.
For e > x > 0 let x = f(x), and for 0 > x > -e let x = - f(x)
where f(x) is some coring function. A useful coring function
is f(x)=sqrt(|x|). Select e such that it is less than the peak
value of the desired signal, but greater than the average noise
signal.

>73 we8w

Well said. The P-38 is a very cost effective and powerful unit.
It out-performs virtually everything else on the market with the
exception of the PTC-II, and its own big brother from HAL. Both
of them cross the pain threshold in cost for most of us.

It doesn't do packet, but HF packet is a poor joke. And it doesn't
do VHF+ packet, perhaps a pity since DSP satellite modems would be
fairly easy to do with its hardware. But what it does, it does very
well.

>the positive case I'ld be happy to receive the modify for it.
>Any advise ???

I don't recomend it. It can be modified to receive 9.6 kb relatively
well, but making it transmit 9.6 kb correctly will be an exercise in
frustration. Like most PLL synthesized radios, it inserts modulation
into the PLL loop filter, and that will distort the 9.6 kb waveform
unacceptably. Its TR turnaround time is also relatively slow.

You'll do much better to procure a simple crystal controlled radio
with direct FM modulation. That'll be easy to adapt to 9.6 kb.

>advantages.

Yes, Dave, you are exactly right. One of the reasons my receiver is
configured the way it is is to eliminate as much analog circuitry
ahead of the DSP as possible. That reduces component count and
analog tolerance stack up and analog nonlinearities. If I were to
go superhet to such a low IF, I'd have all the ills of the conventional
superhet receiver plus the difficulty of dealing with a close in image.
That would require lots of analog filtering ahead of the last analog mixer
to remove, with the corresponding phase non-linearities that implies.

Until DSP gets fast enough to work directly at a high IF where analog
image filtering is not such a challenge, I don't think it is best to use
superhet methods. Using direct on-channel I/Q feeding into the DSP
minimizes problems. The only real problem with this method is limited
dynamic range. A passive step attenuator in the front end is as useful
(or useless depending on your POV) for dealing with that as is AGC in
a superhet. In either case, a strong adjacent signal can depress
receiver sensitivity enough to mask a desired weak signal. If you allow
either to overload, you get IMD products and other distortions, either
in the amps/mixers of the superhet or in the A/D of the direct I/Q design.
The only answer to that is an A/D with a greater number of bits.

83. Netscape & Ethernet Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-05 00:00:00 UTC
From: vk3jma@ozemail.COM.AU
Message-ID: <1.5.4.16.19970106162756.2c272a00@ozemail.com.au>
Source record: 32581

Hello,

I have a question regarding Netscape and other winsock
compliant software and using these with ethernet carsd.

Currently, as with many others, I use Netscape/Eudora
WS_FTP & others with Trumpet for access to my ISP via
my serial port modem!

I am fast approaching the time when I will have a JNOS
system on a seperate computer connected to the TNC/Radio
doing it's little job quitely, collecting mail from our local
nntp/smtp server on the packet radio network.

Now, teh JNOS to ethernet side is, to me, relativly simple,

"attach packet......." in autoexec.nos, approiate packet driver
loaded before NOS, JNOS+ethernet!

Now, how does one setup the "windows" based Internet
software to access the ethernet network connected to the
JNOS box and use it successfully????

And also, what is a simple swap method between ethernet
and trumpet, so as I can still access the internet?

Maybe stupid questions, but none the less, I dont know.

All the best

Mark

: faster can get too expensive and thus unattractive to less than
: diehard packeteers.
:
I have been thinking about calling them for more information on these modules as this would be a VERY cheap way to get into high speed packet! Especially since one version already comes tuned in the 70cm ham band. 433Mhz is right on the edge of FM simplex according to a band plan poster from ICOM that I have here. Now if I could get at least one other person interested in these! Heck who needs an amplifier for cross town packet, just setup a beam.

Just my $0.02

Yes you can do this ... i do it all the time. I use a program
called PKTMON12 that when used with a Hamcomm interface (simple
single 741 op amp circuit) and a scanner yoy can monitor the
packet. The only drawback is that the program will not work with
an XT or some real slow 286's as it relys on processor speed to
do the decoding etc. It does work however, PKTMON12 or just
PKTMON can be found on almost any ham cdrom and at several FTP
sites. Hope that helps!

95. Tripmate GPS Hacking

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-06 00:00:00 UTC
From: gary@ke4zv.atl.ga.us
Message-ID: <1997Jan6.162342.21275@ke4zv.atl.ga.us>
Source record: 32593

Ok, I was at the toy store yesterday and came across this little
jewel. A GPS receiver with serial interface and DeLorme's Street
Atlas 4.0 as a bundle for $149. I couldn't pass it up even though
I already have 2 other GPS receivers and an older version of
Street Atlas. My initial impression of this toy is that it is
very neat, works well and costs little.

So now it is time to tear it apart and find out what makes it
tick. Has anyone already done this? In particular, I want to
extract a high precision timing reference from the unit for
my coherent modulation experiments. Any hints?

Does anyone know what protocol most of the police departments use
for their packet transmission. Is it AX-25 or what? If so, what
baud rate are they likely to be using?

I have the MFJ-1274 and have tried a few things but don't seem
to be having much luck. Any help, please??

I am trying to do some research on digital modulation. I would like to compare BER, PSD, sidelobe power, Bandwidth/Power Efficiency for QPSK, pi/4 DQPSK and Kamilo Feher's FQPSK.

I am in need of any bmp/jpeg pics of these modulators in block diagram form. Any mathcad templates that calculate/simulate any of the above characteristics. I am also interested in any source material or user experiences with these modulation schemes.

Sincerely,

Doug

Didn't see it mentioned, wrt the problem about KAGold changing the params in the TNC. There's a key sequence you can send to the TNC to unlock it, and it's documented in the KAGold manual. (I forget it, haven't used it in a long time (the key sequence...I use KAGold myself)) Also, you can set up two files, startup.??? and shutdown.??? that will set certain params when it starts up, and reset them afterwards. You can also set up individual param preferences and when you have KAGold running, you just trigger this file and it sets up all the stuff you want it to.

BTW, what's the current version of KA-Gold? Methinks it's about time for me to visit the web page and check on updates.

I posted material some time ago regarding the Webb Laboratories Education & Professional Partnership Programs, unprecedented opportunities through which every faculty member, graduate student and undergraduate student (alternatively for the PP program - each member of a working group of designers) can achieve true ownership, at school, home and on the job, of powerful electronic CAE capability. The EP and PP Programs provide general, graphical nodal circuit analysis, RF/microwave-specific analysis, unconstrained nodal noise capability and true 'floating' two-nodes-per-port definition. In addition, the EP and PP Programs include the industry's most comprehensive transmission structure analysis/synthesis engine as well as the powerful SystemPlus suite of design tools for the wireless/receiver/system designer.

The complete EP or PP Program package, including over 500 pages of documentation, may be distributed department/group/consortium/company-wide with no restrictions, without expiration, and at no liability to the School, Group, Consortium or Corporation. EP/PP Program details, an editorial review and a growing example library may be found at:

http://www.webblabs.com/ep.htm

or

http://www.webblabs.com/pp.htm

I ask that you forward this announcement to potentially interested individuals. If you prefer, kindly reply with names and e-mail addresses of those to whom I should convey information directly. Thank you for taking the time to consider what has become a unique access and ownership opportunity for a great number of designers worldwide.

Wishing you a Happy New Year!

By the way I found and was browsing the manufacturers web site after posting my first message and I saw a note that they would produce these transceivers on any frequency between 400 and 500 MHz.

The manufacturer, Radio-Tech Ltd., is in Great Britain and their web site can be found at: http://www.radio-tech.co.uk/ Radio-Tech's US distributor is ABACOM Technologies. No web site, no email listed. Phone number is (416) 242-3120, Fax at (416) 242-2697, Faxback at (416) 242-3082. ABACOM lists the transceiver at $139.30.

73,
Tom - N3NDM

>that *they* will become obsolete.

You are so right! Exactly the same situation exists over here in the UK.
We've somehow achieved a situation where we are using technology that is
almost "cast in stone". A few people experiment, but in general our
packet network is dominated by an unbelievably conservative attitude.

To make it worse, we have a system where you need a special licence to
run a BBS or to run a node on some frequencies. So there are situations
where you actually need to get a licence to experiment - and this system
is supported by and effectively administered by our national radio
society.

I think there is one other problem - packet is a victim of its own
success. The network has become dominated by its ability to carry
messages, and, to many of those involved, the contents of those messages
is more important than the ham radio aspects of the mode. I think that,
at least in the UK, the average BBS sysop is far more concerned with
looking for "naughty" messages than with developing the network.

I tried injecting 9600 TX audio directly into the mod input of the VCO (closest point accessible without going into the VCO) and never could get it to work. I didn't try any external equalization, etc. The discriminator output did however work fine for RX.

You could program the beacon text and CWIDTEXT to say
what you want it to say and use that as the ID. I don't believe
that an ID must occur in a specific area of a digital transmission.
If that were true, we would not have alias calls.

Hi,

We would like to take a minute of your time to inform you of our new Electronics Resource Directory, a free, comprehensive listing of over 500 Web sites of interest to electronics enthusiasts and engineers.

The Directory is available on our web site at:
http://www.netins.net/showcase/elab

If you have an electronics-related web site and would like to add a link to our resource directory from your site, just cut-and-paste the following HTML into your page's source code:

This will place an attractive 'Electronics Resource Directory' logo onto your page that will hot-linked to our Directory for your and your visitor's convenience and use.

We thank you for your time and hope the Electronics Directory will be useful to you. Please let us know if you would like a free listing for your page in our directory!

Hi Curt!

Yes, you are right. Others have had the same problem. Usually they
just use their home callsign in MYCALL and rely upon the CWID to send
their complete reciprocal call. Of course you could set up the beacon
text to include your full callsign and location if you wish and send out
the beacon message at frequent intervals.

The best solution of all is to get a "real" UK callsign!

Hello folks,

I know this newsgroup might not be the best place for the following questions, but I do not know the other place...

So, we are preparing our annual ham conference. Possibly there would be some rules and regulation changes and I like to learn more about the situation in your country/state/province/etc..

1. Is it a membership in your national ham radio union required to regulate
your ham licence status, ham examinations etc.?

2. The same question but related to your local radio club;

3. Is it required in your country to register particularly every RF part in your shack, I mean if you have several radios. Also, is it required to have some technical check of your station every n years to prove your factory-made stuff works as its service manual says?

4. Who gives a licence to you? Your ham union or the government or both? Is there some expire date after you must ask for the re-new papers?

5. If you are involved in a club, does your ham union count you differently or the same as you are union's "direct" member? Also, is there any special membership status for clubs in the union?

6. What are the main goals and duties of your ham radio union? (in short)

7. How do you make a budget in your union (membership fees or..)?

I'd like to see any comment before the 18th of January (conference day)

73 de Misko, YT7MPB@YU7APV.SRB.YUG.EU, the Secretary of YU7 union/s

Previously, I said...
..snip...
>>Having said all that, it does NOT surprise me that packet BBS's
>>are still around. They are a reliable, CHEAP way of shuttling
>>data around the world...and a ham can run an automated program
>>(like TSTHOST, which I use) on a minimal PC and gather up a
>>handful of interesting bulletins every day for almost no cost at
>>all!

Gary replied....
>Well, it isn't cheap from the sysop point of view. If you look at
>the total investment in the typical BBS station, the modems are a
>minute fraction of the expense.

A SYSOP need not spend oodles of money on a good system. FBB (argueably the best BBS software aorund) will run (slowly) on an XT...and aquit itself rather well on an AT.

Radios - Antennae - TNC's... now, those are additional expenses...but at least the SYSOP does not have to plunk down $2500 and crank up a Pentium.

In a previous message, I said...
>>(Yep, hams are cheap...myself included. One of the challenges I
>>like is to see "how much I can do with how little"). At the risk
>>of tooting my own horn a bit...this message is being entered on a
>>1985 full size IBM AT with 640K, 20 and 30 meg hard drives/vga
>>monitor. The software (Nettamer) provides full
>>FTP-USENET-TELNET-E-mail access via a ppp account. The PC also
>>runs TSTHOST...which blows the doors off of TPK and T4.

Gary said...
>Yeah, but what are you accomplishing *on the air*? Your setup could
>work with a faster network, but it doesn't because you won't spend a
>little bit on the radio side to make it happen. Is the cost really

If I upgrade my radio, and then the network ports I can access won't support 9600 baud, what have I gained? It's "chicken or egg" just as you said...

>that big an impediment? I don't think so, I think that's just an
>excuse. I think that the real problem is that 9.6 kb isn't plug
>and play. People are frightened of it because they are afraid they
>won't be able to make it work.

Well, in my case, cost is a factor, as my budget for hamming is vanishingly small. BUT, in a general sense, you're right...cost should not be an issue.

>There is some justification for that fear. 9.6 kb the way we do it
>does require modification of voice grade radios to make it work,
>and some amateur radios simply aren't suitable. But it is
>discouraging to think that *radio* amateurs are afraid to work on
>radios. That's what we're supposed to be about. And ironically, 9.6
>kb is easiest on old cheap crystal controlled radios. Very often,
>those of us doing 9.6 kb and faster have less invested in *both*
>radio and modem than those doing 1200 baud have invested in their
>radio and modem.

That's a good point...but most hams want the latest equipment, and
'plug-and-play'...sigh.

>Actually, the better next step up from 1200 baud is 19.2 kb direct
>FSK. This is very easy to do, and costs *less* than even a 1200
>baud setup. Of course you have to do some *radio* work to make it
>happen.

Yes, it's easy to bite other people's backs when they don't decide to
accept your pet ideas. It's also a poor excuse for an excuse, Rick.

If your ideas are good, get off your can and make them happen. Don't blame
your lack of initiative and effort on other hams who are into different
aspects of the hobby, and have no interest in them..
Fact is: There's plenty of room for folks with new, innovative ideas to
develop them without every packet op on the planet joining them. Most of
the higher-speed stuff works best on higher freqs than are generally used
by the 2m/1.2kb crowd anyway.. What they do or do not do there has no
bearing on high-freq, high speed packet development. You don't want to do
that on 2m anyway. Get real.

Go cry on somebody else's shoulder. I've no sympathy for slackers and
whiners.

Yes, a complete turning away from Amateur Radio to the Internet is the
logical destination for your kind of thinking, Rick. Maybe you should take
that as a hint as to why Hams are so resistant to your ideas.

Think it through, OM. You've been out of touch with packet for years, then
show up at a Ham meeting, telling them how worthless packet radio is and

how much better they would all be to cave in to the Internet as you have done.. The funny part is your shock and dismay when they told you to take your arrogant opinions on down the road. Wish I'd been there.

>If this post has been sent to wrong place I am very sorry

For what? All of us have to start somewhere! You have arrived in the friendliest place in the world, ham radio. Sort of like Internet without wires! <Huge grin>

Once you discover what all this is about, you may embark on a lifetime of discovery. At 44 years into this thing, I am still having fun and, for the most part, the people in it are WAY above average folks.

>Could anyone explain to me what is packet radio, amateur radio and the
>difference between them.

Amateur radio is the permitted use of a relatively large part of the radio channels by individuals who do not have to pay for the right to use the channels. If you look at your broadcast radio, your FM radio and your TV set, you will see they are marked in channel numbers. Never mind about the meaning of that, right now, just discover here that there are MORE channel numbers above and below and between those that you see!

Many, many more. Whole sections of the channels are used by different people for different things! Police, fire people, constuction crews, people sending I love you messages from a cruise ship - they ALL use these other channels and MOST of the time they have to get a LICENSE from the government to use one or more of them.

Hams have to get licenses too. However, the hams use whole chunks of channels. Each chunk has different characteristics. Some chunks can be used to talk directly from Podunk, Texas, to Sydney, Australia, direct! On a good day, you can do that with the power of no more than a FLASHIGHT!

Imagine that, shining a flashlight up in the air and having it seen in Australia! Not only that but your little flashlight can be seen by THOUSANDS of people, all over the world at the SAME TIME! And, its all for free (well, not the cost of the flashlight or the very little for the paper work of the license), totally free, any time of day or night, just holler hello!

It is a priceless, fascinating hobby.... MAGIC that even David Copperfield cannot top.....

Now Packet Radio is a form of radio that packages up blocks of text and numbers into small groups within a larger message. It uses the radio channel to communicate these chunks of text to someone else, and while it is doing it, it makes sure that the chunk was received correctly at the

other end of the circuit. It is just one of MANY forms of amateur radio, but note... it isn't used just by hams. It is also used by fire departments, astronaughts in space... you name it.

>What sort of equipment do I need

A transmitter and receiver that operate upon a channel or set of channels that can be used with a similar type setup on the other end. Cost can be very little or LOTS. Like dogs, or most anything else, some dogs are bigger than other dogs. Ham radio is competitive and the my dog is bigger than your dog deal exists here too! That's part of the fun! It leads to CONTESTS!

There, a well trained little dog can often bite the heck out of even far bigger dogs... expererience and dedication count, just like other sports.

>Does it work worldwide or do I have to be within a distance of (say a tower >or station)

All of the above!

You may talk direct from you to someone else, or go through what we call a repeater station to help you.

Either way, your station uses an antenna. You buy or build your own antennas, some of which need be no larger than a foot or less in size, to HUGE ones that can require towers more than 200 feet high with wire lengths of 2400 to 4000 feet long.

The controlling factor for the tower and antenna size is the channel area. Some channels take bigger antennas than others.

Owning a St. Bernard can be a chore... Using the channels that require the huge antennas above takes space only found out in the country, but there are TONS of channels that can be carried around in your hand or pocket!

<smile>

All dogs are welcome!

>Anything extra would be very valuable

Yes indeed. Go to Radio Shack or a book store or a library and look us up! Your local library is a fine place, or in any event, one of several books you can thumb through is "Now You're Talking", published by one of the fraternal organizations in the hobby called the American Radio Relay League.

If you take it home, the chances are you will be started on this stuff!

In even most smaller cities or even out in the country, chances are someone will know of a "ham operator." Seek the person out, guys and gals abound in this thing!

The rest is all MAGIC!

>pls drop me email direct

Not really. I hope I've answered it in such a way that you will come back here or seek the area that will let you start this fascinating journey!

>Thanks in advance
>
>waheeb
>

121. TNC Interference with VHF Receiver

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-08 00:00:00 UTC
From: Peter and Colleen McGreevy <PMCGREEV@MAIL.IDT.NET>
Message-ID: <32D3EE10.272D@MAIL.IDT.NET>
Source record: 32519

Hi all,

I'm having a problem with my Packet setup, and any suggestions would be appreciated. I am using a PK-88, through the original shielded cable to a Yaesu FT-727 Dual Band HT, then into a Cushcraft Dual Band Ringo. Here's the problem:
When I have the TNC off, I hear all sorts of Braaps, signals, etc. So, I turn on the TNC to put them onto the computer, and Bingo, I get S-9 worth of interference on the radio. Turn off the TNC, no more interference. The TNC is causing some sort of interference with the receiver. I have tried separating the radio and TNC to the maximum distance of the cable, and even moving the system further from the antenna, no use. I have grounded the hole thing together, tried separate grounds, and even linked a few components together, nothing. It is not the computer, because when I turn it on there is no interference. This interference is ONLY on 2 Meters, not 440, which I think could help in solving the problem.

So, that's it, any ideas???

Pete -- KA2YDY

122. WTB: 9600 baud modem?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-08 00:00:00 UTC
From: do440@FreeNet.Carleton.CA
Message-ID: <5avabb$i6j@freenet-news.carleton.ca>
Source record: 32520

Hello!

Anybody have a 9600 baud modem for sale? I'm using a '94 486
Packard Bell with a 2400 baud internal modem on a dialup connection
to a simplex satellite and uplink down to an earthstation near
Ottawa. The fastest anybody in this tiny village can go online is
9600 baud. The echo on the line from the VOX can be maddening, and
it drives the modems nuts without ARQ. I'm wondering if the ham
radio digital community can better advise me on modems and optimum
configuration for this unique link, than the dolt sales guy 1000
miles south of here in Winnipeg who is trying to sell me a 28.8
'cause he doesn't have any 14.4's left, and don't know the
difference between a microvolt and a megahertz, like. :-)

The fax/modem on this machine will go 9600 baud. Why can't I
utilize the fax/modem to go online faster than 2400?

Thanks, ...Orin

125. Yaesu FT-736R and AEA DSP-232 interfacing?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-08 00:00:00 UTC
From: cruff@ncar.ucar.edu
Message-ID: <5b0u73$pqk@ncar.ucar.edu>
Source record: 32523

I'm trying to interface my FT-736R and DSP-232 together. I thought
I'd be able to use the data port on the 736 for FM digital modes
on both 1200 and 9600 baud. However, the 232 doesn't want
to work well on 1200 (I haven't had the time to try 9600 yet) with
the data port. The receive audio is too low for the 232 when attached
to the data port. I also suspect a similar mismatch for the transmit
audio.

The 232 manual suggests a 1:1 transformer on both the receive and
transmit audio lines when attached to the data port. I intend on
trying that later today, but I was wondering if anyone else has done
this? What type of interface did you end up using?

The same question goes for 9600 operation, since I will be getting
around to it in the near future.

I figured out that I will have to use the mic/ext speaker for non-FM modes.

Where did you get the idea that the P38 is a poor performer? QST certainly did not draw that conclusion. The P38 does better than everything else in it's price class by quite a margin -- and I would point out that neither the SCS unit nor Hal's own PCI-4000, while they may be slightly better performers than the P38, are in the same price class.

That has been my conclusion to this issue. I have my CWID set to my
reciprocal callsign. I also set BTEXT to callsign and QTH, but I
usually don't sent out a beacon very often.

>their complete reciprocal call. Of course you could set up the beacon
>text to include your full callsign and location if you wish and send out
>the beacon message at frequent intervals.
>
>The best solution of all is to get a "real" UK callsign!

Thats the plan. But I must first finish my US Amateur Extra. Oh
well, perhaps it would do me good to study for both exams at the
same time. I wonder what questions I could get mixed up? HI HI

>73 es Happy New Year,
>Walt (G3NYY)

And thanks to the usenet comunity for all the replys via e-mail and
the group(s).

Some other interesting facts that came out of this. The MYCALL only
takes 6 characters (as well as MYALIAS) due to AX.25.

In the UK you must ID via CW (actually MCW) anyway so this is
not as big of issue as I thought. In the USA we don't have to use
CWID on Packet (at least anymore).

Is there anyone else here who thinks that NIH syndrome has a lot to do with this?? Long before the Packet Network and all the BBSes were in place I had already done extensive testing of UUCP across packet. Worked fine. I moved Email, binary files, could easily have moved News as well although the channel would have been swamped even then with only 1200 baud TNC's. Why was it necessary to go back to the beginning and re-invent the whole system when the Communications Industry already had some pretty good starting points??

Oh well, I guess I might just as well put the TNC's back in the box and store them up in the attic again. Some things never change.

Hmmm. What problems do you have with the Hal PCI-4000 or the P38 Gary?
Hal certainly has more experience with HF modems than do any of the
other "TNC" manufacturers whose products mostly evolved from simple VHF
Bell 202-compatible modems. In fact, Globe Wireless uses Hal PCI-4000s
for its worldwide HF network on the marine bands.

Any "terminal program" will work such as Procomm Plus or the like.

There are also some packet term programs such as Winpack (for Windows), and PaKet 6.1 (for DOS), to name a few.

You can also run packet with the simple terminal program that comes with Windows...but that program is the bottom-of-the-barrel. :)

Take care.

Good suggestion. But no good. MYALIAS still only will take 6
characters [tested on KAM Plus V8].

Pete,

There is a capacitor on the board that creates a birdy around 145.01 Mhz.
I had the same problem. All one has to do is take out this cap and replace it
with a value slightly off so that it shifts the birdy.

You can find the article about it on oak.oakland under the mods directory
in AEA I think. If you can't find it I have it laying around somewhere also.

TTYL,
Mike

140. Q:TX/RX packet program for Hamcomm TX/RX interface

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-09 00:00:00 UTC
From: tswisher@freenet.columbus.oh.us
Message-ID: <5b3p94$kjh@login.freenet.columbus.oh.us>
Source record: 32456

Is there a shareware or freeware packet program out there (similar to Pktmon, which is receive only) that can be used with the Hamcomm interface for both transmit and receive? I remember seeing Poor Man's Packet a few years ago in 73, but can't find the article, and don't recall if it used a Hamcomm interface or another type. Any ideas?

Thanks,

Tom N8GQK

Dennis, you might want to check out MFJ's MultiCom for Windows (1289W). It was advertised in the November issue of QST and there was a 2-part article about it in the December and January issues of CQ. You can order it directly from MFJ or from its dealers.

I am the author of the program, so this is not an unbiased suggestion hi hi :-)

>-Tom
>
Well can't speak for Boston but what I've seen in Maryland
is that activity has dropped way off. I think two things caused this.
First was and is the internet. It has taken over packets place
for a lot of things. The other, in this area, was some really
dumb things by the packet boards themselves. They put all the
boards in one area on the same freq. Result, collisions up the
wazoo and it took forever to get data from the board. Not exactly
smart. Anyway that's my 2 cents. Jack WB3ICL

Message-ID: <32D5712C.15CA@amsat.org>
Source record: 32460

I have a TAPR/AMSAT DSP-93 kit for sale. Unit has been professionally
built, checked out and works just super. Have orignal box, paperwork,
manuals, cables, etc. Does all current HF and VHF/UHF digital modes.
Modems are changed and updated via software so the unit never becomes
"dated".
TAPR's kit price on this unit is $430, I am asking $450 for
mine assembled! Compare this unit the the AEA DSP2232 which retails over
$1100.
You may contact me via email at kg2ic@amsat.org or call 716/625-8800 or
716/689-6727.

Well, I can figure... all these folks running nodes/bbs's seem to be
and remain ham radio amateurs ie people interested in some
experimenting,
building, soldering, wiring etc. I would not expect from those casual
"internet amateurs" seeking for ready-made infos to be interested in
a slow-train net, particularly not to build or run hard/software and
improve there technical knowledge this way. I also have FREE e-mail
at two universities here (in Novi Sad and in Belgrade) at the high
speed, but I usualy feel much better using bbs (act
any tcpip software developed for VAX/VMS?
At the local university they moved from VAX to PC/Linux equipment. If
they allow me to experiment with tcpip via radio, I'd like to use this
retired VAX. So, any info is welcomed.

` Hi Waheeb...

My name is Carlos Alberto...
I'm amateur radio of Brazil...
I not write english very well, but lets go...
The packet radio is a mode of transmition an reception of
digitals signals..
Amateur radio is a class of people with make conversation from
radio equipment.
We have very others modes.. SSB, CW, RTTY, AMTOR, PACTOR,
GTOR, SSTV, SATELITE....
I hope help you...
See about amateur radio in ALTAVISTA SEARCH in ARRL
Bye Bye...

Check the tnc and see if the xtal osc has a trimmer cap. On some tnc's the internal osc has a birdie on some freq and usually the one you want to use. If this is the case, then a touch of the cap will move the birdie and allow you to receive. This was common on some the older units.

I tried injecting 9600 TX audio directly into the mod input of the VCO
(closest point accessible without going into the VCO) and never could
get it to work. I didn't try any external equalization, etc. The
discriminator output did however work fine for RX.

Take a look at the PCI-4000 from HAL and the SCS PTC-II.
Both companies (HAL and SCS) have web pages.
(Sorry, don't have the URLs here at work)

From: p.piercey@thezone.net (Paul J. Piercey)
Subject: Expanded MYCall in a TNC.

Hello all,

I have a little problem that I hope someone out there can help me with.

Currently, for 1997, our club, the Society of Newfoundland Radio Amateurs is operating our VO1AA club station under the callsign VO500JC, in commemoration of the 500th anniversary of John Cabot's voyage to the New World. Located at the station is an old version (3.0 or so) of the KAM that I would like to be able to use on the digital modes. In trying to set it up, I ran into the problem that the TNC won't accept the callsign as the MYCall. It is one character too long.

What I would like to know is if it is possible to set up the TNC to accept it by some other means. If the newer firmware can handle it then that would be an easy fix but it would be nice to give the digital operators a chance to work the callsign.

Thanks in advance.

==========

If they can do this, will it cost more because it is custom? Just
an idea.

TTYL,
Mike

>TMAN

Yes you can do this ... i do it all the time. I use a program
called PKTMON12 that when used with a Hamcomm interface (simple
single 741 op amp circuit) and a scanner yoy can monitor the
packet. The only drawback is that the program will not work with
an XT or some real slow 286's as it relys on processor speed to
do the decoding etc. It does work however, PKTMON12 or just
PKTMON can be found on almost any ham cdrom and at several FTP
sites. Hope that helps!

You could program the beacon text and CWIDTEXT to say
what you want it to say and use that as the ID. I don't believe
that an ID must occur in a specific area of a digital transmission.
If that were true, we would not have alias calls.

Hi Curt!

Yes, you are right. Others have had the same problem. Usually they
just use their home callsign in MYCALL and rely upon the CWID to send
their complete reciprocal call. Of course you could set up the beacon
text to include your full callsign and location if you wish and send out

the beacon message at frequent intervals.

The best solution of all is to get a "real" UK callsign!

Subject: Rules in your street

Hello folks,

I know this newsgroup might not be the best place for the following
questions, but I do not know the other place...

So, we are preparing our annual ham conference. Possibly there would
be some rules and regulation changes and I like to learn more about
the situation in your country/state/province/etc..

1. Is it a membership in your national ham radio union required to
regulate
your ham licence status, ham examinations etc.?

2. The same question but related to your local radio club;

3. Is it required in your country to register particularly every RF
part in your shack, I mean if you have several radios. Also, is it
required to have some technical check of your station every n years
to prove your factory-made stuff works as its service manual says?

4. Who gives a licence to you? Your ham union or the government or both?
Is there some expire date after you must ask for the re-new papers?

5. If you are involved in a club, does your ham union count you
differently or the same as you are union's "direct" member? Also,
is there any special membership status for clubs in the union?

6. What are the main goals and duties of your ham radio union? (in
short)

7. How do you make a budget in your union (membership fees or..)?

I'd like to see any comment before the 18th of January (conference day)

73 de Misko, YT7MPB@YU7APV.SRB.YUG.EU, the Secretary of YU7 union/s

Subject: Tripmate GPS Hacking

Ok, I was at the toy store yesterday and came across this little
jewel. A GPS receiver with serial interface and DeLorme's Street
Atlas 4.0 as a bundle for $149. I couldn't pass it up even though
I already have 2 other GPS receivers and an older version of
Street Atlas. My initial impression of this toy is that it is
very neat, works well and costs little.

So now it is time to tear it apart and find out what makes it
tick. Has anyone already done this? In particular, I want to
extract a high precision timing reference from the unit for
my coherent modulation experiments. Any hints?

Subject: WTB: 9600 baud modem?

Hello!

Anybody have a 9600 baud modem for sale? I'm using a '94 486
Packard Bell with a 2400 baud internal modem on a dialup connection
to a simplex satellite and uplink down to an earthstation near
Ottawa. The fastest anybody in this tiny village can go online is
9600 baud. The echo on the line from the VOX can be maddening, and
it drives the modems nuts without ARQ. I'm wondering if the ham
radio digital community can better advise me on modems and optimum
configuration for this unique link, than the dolt sales guy 1000
miles south of here in Winnipeg who is trying to sell me a 28.8
'cause he doesn't have any 14.4's left, and don't know the
difference between a microvolt and a megahertz, like. :-)

The fax/modem on this machine will go 9600 baud. Why can't I
utilize the fax/modem to go online faster than 2400?

Thanks, ...Orin

Then it's time to look at a Linux kernel 2.1.17 or so, or at
PC/FlexNet (http://home.pages.de/~flexnet) for DOS
But speed isn't too great, usually in the 1.2kbps range, since
unmodified HTs usually have a horrible frequency response.

Where did you get the idea that the P38 is a poor performer? QST
certainly did not draw that conclusion. The P38 does better than
everything else in it's price class by quite a margin -- and I would
point out that neither the SCS unit nor Hal's own PCI-4000, while they
may be slightly better performers than the P38, are in the same price
class.

I tried injecting 9600 TX audio directly into the mod input of the VCO
(closest point accessible without going into the VCO) and never could
get it to work. I didn't try any external equalization, etc. The
discriminator output did however work fine for RX.

From: "Doug Montgomery" <dmontgom@lantirn.robins.af.mil>
Subject: Digital modulation

I am trying to do some research on digital modulation. I would like to compare BER, PSD, sidelobe power, Bandwidth/Power Efficiency for QPSK, pi/4 DQPSK and Kamilo Feher's FQPSK.

I am in need of any bmp/jpeg pics of these modulators in block diagram form. Any mathcad templates that calculate/simulate any of the above characteristics. I am also interested in any source material or user experiences with these modulation schemes.

Sincerely,

Doug

Take a look at the PCI-4000 from HAL and the SCS PTC-II.
Both companies (HAL and SCS) have web pages.

From: p.piercey@thezone.net (Paul J. Piercey)
Subject: Expanded MYCall in a TNC.

Hello all,

I have a little problem that I hope someone out there can help me with.

Currently, for 1997, our club, the Society of Newfoundland Radio Amateurs is operating our VO1AA club station under the callsign VO500JC, in commemoration of the 500th anniversary of John Cabot's voyage to the New World. Located at the station is an old version (3.0 or so) of the KAM that I would like to be able to use on the digital modes. In trying to set it up, I ran into the problem that the TNC won't accept the callsign as the MYCall. It is one character too long.

What I would like to know is if it is possible to set up the TNC to accept it by some other means. If the newer firmware can handle it then that would be an easy fix but it would be nice to give the digital operators a chance to work the callsign.

Thanks in advance.

If they can do this, will it cost more because it is custom? Just an idea.

TTYL,
Mike

>TMAN

Yes you can do this ... i do it all the time. I use a program
called PKTMON12 that when used with a Hamcomm interface (simple
single 741 op amp circuit) and a scanner yoy can monitor the
packet. The only drawback is that the program will not work with
an XT or some real slow 286's as it relys on processor speed to
do the decoding etc. It does work however, PKTMON12 or just
PKTMON can be found on almost any ham cdrom and at several FTP
sites. Hope that helps!

Subject: KAM Plus Callsign Issue

I am operating in England as M/KB9JQU and have found a small problem
when trying to operate HF or VHF Packet. A Kantronics KPC-3 or KAM
Plus do not allow me to assign M/KB9JQU to MYCALL.

A telephone call today to Kantronics confirmed this.

Has anyone else been in this situitaiton and found an alternative to
M/? I can set the CW ID to M/KB9JQU and legally ID. Any ideas?

You could program the beacon text and CWIDTEXT to say
what you want it to say and use that as the ID. I don't believe
that an ID must occur in a specific area of a digital transmission.
If that were true, we would not have alias calls.

Hi Curt!

Yes, you are right. Others have had the same problem. Usually they
just use their home callsign in MYCALL and rely upon the CWID to send
their complete reciprocal call. Of course you could set up the beacon
text to include your full callsign and location if you wish and send out
the beacon message at frequent intervals.

The best solution of all is to get a "real" UK callsign!

Subject: Rules in your street

Hello folks,

I know this newsgroup might not be the best place for the following
questions, but I do not know the other place...

So, we are preparing our annual ham conference. Possibly there would
be some rules and regulation changes and I like to learn more about
the situation in your country/state/province/etc..

1. Is it a membership in your national ham radio union required to
regulate
your ham licence status, ham examinations etc.?

2. The same question but related to your local radio club;

3. Is it required in your country to register particularly every RF
part in your shack, I mean if you have several radios. Also, is it
required to have some technical check of your station every n years
to prove your factory-made stuff works as its service manual says?

4. Who gives a licence to you? Your ham union or the government or both?
Is there some expire date after you must ask for the re-new papers?

5. If you are involved in a club, does your ham union count you
differently or the same as you are union's "direct" member? Also,
is there any special membership status for clubs in the union?

6. What are the main goals and duties of your ham radio union? (in
short)

7. How do you make a budget in your union (membership fees or..)?

I'd like to see any comment before the 18th of January (conference day)

73 de Misko, YT7MPB@YU7APV.SRB.YUG.EU, the Secretary of YU7 union/s

Subject: Tripmate GPS Hacking

Ok, I was at the toy store yesterday and came across this little
jewel. A GPS receiver with serial interface and DeLorme's Street
Atlas 4.0 as a bundle for $149. I couldn't pass it up even though
I already have 2 other GPS receivers and an older version of
Street Atlas. My initial impression of this toy is that it is
very neat, works well and costs little.

So now it is time to tear it apart and find out what makes it
tick. Has anyone already done this? In particular, I want to
extract a high precision timing reference from the unit for
my coherent modulation experiments. Any hints?

Subject: WTB: 9600 baud modem?

Hello!

Anybody have a 9600 baud modem for sale? I'm using a '94 486
Packard Bell with a 2400 baud internal modem on a dialup connection
to a simplex satellite and uplink down to an earthstation near
Ottawa. The fastest anybody in this tiny village can go online is
9600 baud. The echo on the line from the VOX can be maddening, and
it drives the modems nuts without ARQ. I'm wondering if the ham
radio digital community can better advise me on modems and optimum
configuration for this unique link, than the dolt sales guy 1000
miles south of here in Winnipeg who is trying to sell me a 28.8
'cause he doesn't have any 14.4's left, and don't know the
difference between a microvolt and a megahertz, like. :-)

The fax/modem on this machine will go 9600 baud. Why can't I
utilize the fax/modem to go online faster than 2400?

Thanks, ...Orin

Subject: Kansas City Packet---What happened?

Is there anyone else here who thinks that NIH syndrome has a lot to do
with this?? Long before the Packet Network and all the BBSes were in
place I had already done extensive testing of UUCP across packet. Worked
fine. I moved Email, binary files, could easily have moved News as well
although the channel would have been swamped even then with only 1200 baud
TNC's. Why was it necessary to go back to the beginning and re-invent the
whole system when the Communications Industry already had some pretty good
starting points??

Oh well, I guess I might just as well put the TNC's back in the box and
store them up in the attic again. Some things never change.

Any "terminal program" will work such as Procomm Plus or the like.

There are also some packet term programs such as Winpack (for Windows), and PaKet 6.1 (for DOS), to name a few.

You can also run packet with the simple terminal program that comes with Windows...but that program is the bottom-of-the-barrel. :)

Take care.

Subject: TNC Interference with VHF Receiver

Hi all,

I'm having a problem with my Packet setup, and any suggestions would be appreciated. I am using a PK-88, through the original shielded cable to a Yaesu FT-727 Dual Band HT, then into a Cushcraft Dual Band Ringo. Here's the problem:
When I have the TNC off, I hear all sorts of Braaps, signals, etc. So, I turn on the TNC to put them onto the computer, and Bingo, I get S-9 worth of interference on the radio. Turn off the TNC, no more interference. The TNC is causing some sort of interference with the receiver. I have tried separating the radio and TNC to the maximum distance of the cable, and even moving the system further from the antenna, no use. I have grounded the hole thing together, tried separate grounds, and even linked a few components together, nothing. It is not the computer, because when I turn it on there is no interference. This interference is ONLY on 2 Meters, not 440, which I think could help in solving the problem.

So, that's it, any ideas???

From: cruff@ncar.ucar.edu (Craig Ruff)
Subject: Yaesu FT-736R and AEA DSP-232 interfacing?

I'm trying to interface my FT-736R and DSP-232 together. I thought I'd be able to use the data port on the 736 for FM digital modes on both 1200 and 9600 baud. However, the 232 doesn't want to work well on 1200 (I haven't had the time to try 9600 yet) with the data port. The receive audio is too low for the 232 when attached to the data port. I also suspect a similar mismatch for the transmit audio.

The 232 manual suggests a 1:1 transformer on both the receive and
transmit audio lines when attached to the data port. I intend on
trying that later today, but I was wondering if anyone else has done
this? What type of interface did you end up using?

The same question goes for 9600 operation, since I will be getting
around to it in the near future.

I figured out that I will have to use the mic/ext speaker for non-FM modes.

Waheeb. For lots of information on Packet and the digital modes -- go to
the DX Reference page below.

For What is Amateur Radio and how to become one go to the INDEX Page,
then ARRL Home pages. Tons of info for u there. The ARRL will send u a
packet of info upon request. See how to get started in Amateur Radio on
the ARRL Pages.

Good luck

Happy New Year, all.

I'd like to be able to record (unattended) my favorite radio programs and features for later listening. Something like a VCR with multi-event programming would do the job nicely. Some have suggested using a VCR and a tuner connected to the audio input, but that would require going back and retuning the receiver to different stations between events, which is not possible in this case.

Any ideas? Thank you in advance.
Michael

Source record: 32548

Okay folks, I went out to Rat Shack and buought some caps. I couldn't find the exact one i needed, so I parralleled a 33 picofarad and a 15 picofarad with the existing 33 picofarad (33+33+15=81, close enough to AEA's reccommended fix of 82pf, right?)..... no good. I still get an S-9 of birdie. No, I have not tried wrapping the rig in tin foil.... it would cook itself to death on xmit.

So, any ideas? is what I did correct with what AEA says, which is:

HERE:
Subject: Re: PK-88 RFI problems

> Hardware: AEA PK-88, battery powered, out of warranty
>
> Problem: With no cables except power connected, the PK-88
> generates enough RFI on 145.01 to open the squelch on
> my Kenwood TH-215A (squelch set to max; duck) about
> 30 feet away.

AEA says the clock on the PK-88 does indeed put out a birdie on 145.01, but
they do have a mod you can make to fix the situation. The clock frequency is
controlled by C38, a 33 pF capacitor. If you change this to an 82 pF cap (use a silver mica cap), it will lower the clock frequency enough to move the birdie out of the packet band. (Hopefully, you won't RFI your use or your neighbor's use of another part of the 2M band! WA2ISE).

If you have any trouble, call Ryan at AEA customer service at 206 775-7373.

Good Luck,

Kevin Redden, WB2ZLF
AT&T Bell Labs, Lincroft NJ

++++++++++++

Needless to say,. AEA is no longer answering its phones....

So, anything else I can try before I sell it?

Tnx - Pete - KA2YDY

> Attention ! Dieu est une hypothese; consommez avec moderation

It has been a while since I checked this out, but last I checked you could
use these two items:

SoftKiss, a driver for the KISS protocol that works as an extension or
control panel or something,

and the Net/Mac TCP/IP software package (which will also run AX.25).

There is also a package called Savant which is a packet program for the
Mac (commercial) -- I think it will drive a packet modem like Baycom on
the serial port.

I wish I knew how to find them, but the standard Internet search engines
should find them for you.

Okay, I'm replying to myself again...

Here's what happened, the above mentioned capacitor fix worked, somewhat. Before the fix, there was interference whether the cable between the rig and the TNC was connected or not. Now, the interference is only there when I connect the cable to the TNC, ... not even when it is also connected to the rig.....

So.... ferrite bead the cable???

Me, too!

I bought a Reveal FM radio board for the PC (about $40 at Best Buy), with the idea of being able to program it as you suggest.

<flame> I got disgusted at the dain-bramaged software that came with it (only 10 presets, hard to set with fixed scroll rate, roundoff errors in freq display, . . .). I'd have kept it if I could have gotten specs for how to control it -- I'd have written a control program myself. But their "24/7" tech support line put me on permahold so I gave up and returned it. </flame> I could always buy another one if I decide to try it again someday. It seemed like a well-build piece of hardware.

Seems like you could build an integrated control out of an old XT with the FM radio card in it and an IR emitter to drive the VCR. If the VCR won't record sound without a video signal to sync to, put a CGA card in the PC; you could put a timestamp on the video to tell you when the audio was sent, freq, station/program ID, etc., in nice bold characters that would show up in fast forward / rewind.

If your existing FM receiver is IR controllable, then that opens other possibilities.

I agree, this is a product that is missing from the marketplace. Probably wouldn't be terribly hard for the VCR makers to implement, either; they already have the front end, what's a couple more chips for the FM broadcast IF and detector? They can sell an entire Walkman for $cheap. . . It'd be neat: an 8-hour stereo audio recorder! There's not much on the tube worth watching, anyway.

We can't be the only two who've felt this need. Ideas, anyone?

From: bblohm@boi.hp.com (Bill Blohm)
Subject: KaGold

Didn't see it mentioned, wrt the problem about KAGold changing the params in the TNC. There's a key sequence you can send to the TNC to unlock it, and it's documented in the KAGold manual. (I forget it, haven't used it in a long time (the key sequence...I use KAGold myself)) Also, you can set up two files, startup.??? and shutdown.??? that will set certain params when it starts up, and reset them afterwards. You can also set up individual param preferences and when you have KAGold running, you just trigger this file and it sets up all the stuff you want it to.

BTW, what's the current version of KA-Gold? Methinks it's about time for me to visit the web page and check on updates.

Subject: KAM Plus Callsign Issue

>Yes, you are right. Others have had the same problem. Usually they
>just use their home callsign in MYCALL and rely upon the CWID to send

That has been my conclusion to this issue. I have my CWID set to my reciprocal callsign. I also set BTEXT to callsign and QTH, but I usually don't sent out a beacon very often.

>their complete reciprocal call. Of course you could set up the beacon
>text to include your full callsign and location if you wish and send out
>the beacon message at frequent intervals.
>
>The best solution of all is to get a "real" UK callsign!

Thats the plan. But I must first finish my US Amateur Extra. Oh well, perhaps it would do me good to study for both exams at the same time. I wonder what questions I could get mixed up? HI HI

>73 es Happy New Year,
>Walt (G3NYY)

And thanks to the usenet comunity for all the replys via e-mail and the group(s).

Some other interesting facts that came out of this. The MYCALL only takes 6 characters (as well as MYALIAS) due to AX.25.

In the UK you must ID via CW (actually MCW) anyway so this is not as big of issue as I thought. In the USA we don't have to use CWID on Packet (at least anymore).

Where did you get the idea that the P38 is a poor performer? QST certainly did not draw that conclusion. The P38 does better than everything else in it's price class by quite a margin -- and I would point out that neither the SCS unit nor Hal's own PCI-4000, while they may be slightly better performers than the P38, are in the same price class.

I tried injecting 9600 TX audio directly into the mod input of the VCO
(closest point accessible without going into the VCO) and never could
get it to work. I didn't try any external equalization, etc. The
discriminator output did however work fine for RX.

From: "Doug Montgomery" <dmontgom@lantirn.robins.af.mil>
Subject: Digital modulation

I am trying to do some research on digital modulation. I would like to
compare BER, PSD, sidelobe power, Bandwidth/Power Efficiency for QPSK, pi/4
DQPSK and Kamilo Feher's FQPSK.

I am in need of any bmp/jpeg pics of these modulators in block diagram
form. Any mathcad templates that calculate/simulate any of the above
characteristics. I am also interested in any source material or user
experiences with these modulation schemes.

Sincerely,

Doug

Take a look at the PCI-4000 from HAL and the SCS PTC-II.
Both companies (HAL and SCS) have web pages.

From: p.piercey@thezone.net (Paul J. Piercey)
Subject: Expanded MYCall in a TNC.

Hello all,

I have a little problem that I hope someone out there can help me with.

Currently, for 1997, our club, the Society of Newfoundland Radio Amateurs is operating our VO1AA club station under the callsign VO500JC, in commemoration of the 500th anniversary of John Cabot's voyage to the New World. Located at the station is an old version (3.0 or so) of the KAM that I would like to be able to use on the digital modes. In trying to set it up, I ran into the problem that the TNC won't accept the callsign as the MYCall. It is one character too long.

What I would like to know is if it is possible to set up the TNC to accept it by some other means. If the newer firmware can handle it then that would be an easy fix but it would be nice to give the digital operators a chance to work the callsign.

Thanks in advance.

>TMAN

Yes you can do this ... i do it all the time. I use a program
called PKTMON12 that when used with a Hamcomm interface (simple
single 741 op amp circuit) and a scanner yoy can monitor the
packet. The only drawback is that the program will not work with
an XT or some real slow 286's as it relys on processor speed to
do the decoding etc. It does work however, PKTMON12 or just
PKTMON can be found on almost any ham cdrom and at several FTP
sites. Hope that helps!

You could program the beacon text and CWIDTEXT to say
what you want it to say and use that as the ID. I don't believe
that an ID must occur in a specific area of a digital transmission.
If that were true, we would not have alias calls.

Hi Curt!

Yes, you are right. Others have had the same problem. Usually they
just use their home callsign in MYCALL and rely upon the CWID to send
their complete reciprocal call. Of course you could set up the beacon
text to include your full callsign and location if you wish and send out
the beacon message at frequent intervals.

The best solution of all is to get a "real" UK callsign!

Subject: Rules in your street

Hello folks,

I know this newsgroup might not be the best place for the following
questions, but I do not know the other place...

So, we are preparing our annual ham conference. Possibly there would
be some rules and regulation changes and I like to learn more about
the situation in your country/state/province/etc..

1. Is it a membership in your national ham radio union required to
regulate
your ham licence status, ham examinations etc.?

2. The same question but related to your local radio club;

3. Is it required in your country to register particularly every RF
part in your shack, I mean if you have several radios. Also, is it
required to have some technical check of your station every n years
to prove your factory-made stuff works as its service manual says?

4. Who gives a licence to you? Your ham union or the government or both?
Is there some expire date after you must ask for the re-new papers?

5. If you are involved in a club, does your ham union count you
differently or the same as you are union's "direct" member? Also,
is there any special membership status for clubs in the union?

6. What are the main goals and duties of your ham radio union? (in
short)

7. How do you make a budget in your union (membership fees or..)?

I'd like to see any comment before the 18th of January (conference day)

73 de Misko, YT7MPB@YU7APV.SRB.YUG.EU, the Secretary of YU7 union/s

From: do440@FreeNet.Carleton.CA (Orin Durey)
Subject: WTB: 9600 baud modem?

Hello!

Anybody have a 9600 baud modem for sale? I'm using a '94 486
Packard Bell with a 2400 baud internal modem on a dialup connection
to a simplex satellite and uplink down to an earthstation near
Ottawa. The fastest anybody in this tiny village can go online is
9600 baud. The echo on the line from the VOX can be maddening, and
it drives the modems nuts without ARQ. I'm wondering if the ham
radio digital community can better advise me on modems and optimum
configuration for this unique link, than the dolt sales guy 1000
miles south of here in Winnipeg who is trying to sell me a 28.8
'cause he doesn't have any 14.4's left, and don't know the
difference between a microvolt and a megahertz, like. :-)

The fax/modem on this machine will go 9600 baud. Why can't I
utilize the fax/modem to go online faster than 2400?

Thanks, ...Orin

Subject: Kansas City Packet---What happened?

Is there anyone else here who thinks that NIH syndrome has a lot to do
with this?? Long before the Packet Network and all the BBSes were in
place I had already done extensive testing of UUCP across packet. Worked
fine. I moved Email, binary files, could easily have moved News as well
although the channel would have been swamped even then with only 1200 baud
TNC's. Why was it necessary to go back to the beginning and re-invent the
whole system when the Communications Industry already had some pretty good
starting points??

Oh well, I guess I might just as well put the TNC's back in the box and
store them up in the attic again. Some things never change.

Any "terminal program" will work such as Procomm Plus or the like.

There are also some packet term programs such as Winpack (for Windows),
and PaKet 6.1 (for DOS), to name a few.

You can also run packet with the simple terminal program that comes with
Windows...but that program is the bottom-of-the-barrel. :)

Take care.

From: Peter and Colleen McGreevy <PMCGREEV@MAIL.IDT.NET>
Subject: TNC Interference with VHF Receiver

Hi all,

I'm having a problem with my Packet setup, and any suggestions
would be appreciated. I am using a PK-88, through the original shielded
cable to a Yaesu FT-727 Dual Band HT, then into a Cushcraft Dual Band
Ringo. Here's the problem:

When I have the TNC off, I hear all sorts of Braaps, signals,
etc. So, I turn on the TNC to put them onto the computer, and Bingo, I
get S-9 worth of interference on the radio. Turn off the TNC, no more
interference. The TNC is causing some sort of interference with the
receiver. I have tried separating the radio and TNC to the maximum
distance of the cable, and even moving the system further from the
antenna, no use. I have grounded the hole thing together, tried
separate grounds, and even linked a few components together, nothing. It
is not the computer, because when I turn it on there is no interference.
This interference is ONLY on 2 Meters, not 440, which I think could help
in solving the problem.

So, that's it, any ideas???

From: cruff@ncar.ucar.edu (Craig Ruff)
Subject: Yaesu FT-736R and AEA DSP-232 interfacing?

I'm trying to interface my FT-736R and DSP-232 together. I thought
I'd be able to use the data port on the 736 for FM digital modes
on both 1200 and 9600 baud. However, the 232 doesn't want
to work well on 1200 (I haven't had the time to try 9600 yet) with
the data port. The receive audio is too low for the 232 when attached
to the data port. I also suspect a similar mismatch for the transmit
audio.

The 232 manual suggests a 1:1 transformer on both the receive and
transmit audio lines when attached to the data port. I intend on
trying that later today, but I was wondering if anyone else has done
this? What type of interface did you end up using?

The same question goes for 9600 operation, since I will be getting
around to it in the near future.

I figured out that I will have to use the mic/ext speaker for non-FM modes.

170. www.hamradio-online.com: FCC CREATES 300 MHZ of UNLICENSED spectrum

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-10 00:00:00 UTC
From: vbook@vbook.com
Message-ID: <5b4jhs$nlq@kanga.accessone.com>
Source record: 32470
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.policy,rec.radio.amateur.homebrew

Today, the FCC issued a Report and Order creating three 100 MHz wide bands in the 5 GHz area for use by unlicensed wireless devices. The bands include changes to the rules in the Amateur shared allocation at 5.725 to 5.825 GHz. Under the new rules, unlicensed devices may operate up to 4 watts EIRP (depending on the band) and may optionally use high gain directional antennas (depending on the band).

Today's ruling make possible high speed wireless Internet access over potentially several miles. You can expect to see unlicensed wireless T-1 (1.544 Mbps links) service drastically undercutting the costs of renting T-1 lines from local phone companies (often $3,000 per month). Many other applications are expected to be deployed under the new rules on the new frequencies.

This is a tremendously important announcement in terms of the future of Internet access and short range wireless communications. It also involves the Amateur service as one of the three bands is shared with Amateur Radio.

We have the FCC press release and full text of the Report and Order at http://www.hamradio-online.com

My preference is for serial port boxes over plug in boards. I do all my ham radio stuff from my laptop -- cuz' my main PCs just put out so much RF noise. I figure what's the point of buying a $500 modem if the computer is gonna' spit noise all over the signal I'm trying to receive. The laptop is way quieter.

176. Real High Speed Digital

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-10 00:00:00 UTC
From: Igor Vonowski <vonowski@sound.net>
Message-ID: <32D6B0CC.6E86@sound.net>
Source record: 32476

I noticed in the '94 ARRL Handbook an article about digital communications at a respectable 2 Mbit/s. I haven't gotten into packet because my days of 300-1200 baud are through. Microwave links could change my view.

My questions are:
The article talks about inexpensive "Gunn transceivers, such as are used to open supermarket doors."

1. What are "Gunn" (or Gunnplexer) transceivers?

2. What qualifies as "inexpensive"?

3. Where can I get them?

4. Is this method worth learning more about (probably)?

5. What do I need besides the transceiver, dish, pc, patience and knowledge?

Any information would be helpful, as the microwave books at my local library seem to be rather dated and deal more with theory that with any practical application.

Thank you in advance,
Mark

How precise does your time need to be?

Do you need "real" time or just a very precise clock which is not
necessarily synchronized with "real" time.

What device will use the time?

I am interested in tinkering with the GPS receivers
on PC cards (both ISA and PCMCIA appear to available). Potential
advantages appear to include low jitter and low latency in accessing
the clock, (e.g., due to interrupt processing, serialization delay, and
a bunch of other stuff if you are accessing via a serial port or
NTP and system clock issues if you are using NTP to synchronize with
an external GPS clock).

Does anyone have anyone experience with these PC card GPS receivers?

We will probably get one before too long, if anyone is interested
in sharing experiences.

I don't think this is a good way to go. I'd suggest programming to a common API spec such as the Clarkson packet driver API for those still stuck in the DOS world, or just use a ptty or a socket interface under a real OS. Using a PC as just a TNC is overkill even at today's low PC hardware prices. You might as well make the PC do everything since it doesn't cost much more to equip it to be a real machine. Basically you need to add display, keyboard, and a hard drive to your "PC TNC" to make it do everything. That's cheaper than having to have another computer emulate a dumb terminal. And if a real OS is used, real applications could make use of the radio network linkage in an efficient and tightly coupled manner.

>The PC configuration would look something like this:
>
> - Sound Blaster DSP card

AFAIK the Sound Blaster "DSP" isn't user programable at the level of running modem code we might write. The Cardinal soundcard with the PSA chipset *is* a fully programable DSP, but they're hard to find. Generic sound cards are only useful for ADDA conversions, with the main PC processor doing the actual DSP number crunching. For a fancy modem, that means a Pentium with MMX extensions. For more mundane modems, a 486 will do. Fortunately, the latter have gotten cheap. We need to walk before we can run, so our initial activities should be aimed at implementing simpler modems anyway.

I think we'd like this to run on generic hardware so that anyone with a PC and sound card can play. That limits us to less than the most exotic DSP modems, but we can still do a lot with this. By the time we need more processing power, Pentiums with MMX should have fallen in price to the point where a motherboard transplant won't be painful to "everyham" (we have to keep in mind the multimedia laptop users, however, they won't be able to do a "brain" transplant cheaply, so we need to keep the reference platform at a reasonable level for quite some time).

> - 4 Megs of RAM

Might as well have 16M, memory is cheap now. You can run Linux in
4M, but it thrashes a lot. A large memory store also lets you run
a really fancy memory ARQ, IE you can rescan the raw data several
times in several different ways to piece together valid packets
without having to force a perfect packet through over the air by
multiple repeats.

>I would like to see it support HF Modes (RTTY, ASCII, AMTOR, PACTOR),
>SSTV, FAX, VHF Packet, and also the satellite modes like BPSK.

Well, most of that is available in one form or another already.
The challenge would be to pull it all together and make it work
in a user friendly shell with a consistent interface. That's why
you want the modems to conform to a common API, then one consistent
shell can access any mode. (That's basically how the HAL P-38 works.)

>Unfortunatly, I don't have that much DSP experience to do this or I would
>have done it already.
>
>If anyone is interested, lets start the project! I think it could turn
>out to be very fun.
>
>I'm willing to start a mailing list on my machine to kick of the discussions.

I think a collaborative internet project would be an excellent idea.
The open model used by GNU and Linux has shown that such projects can
work, and produce excellent results. I think we need to define our
objective fairly closely before we jump into this too heavily, however,
and I'd note that the TAPR HF SIG and DSP SIG are in some senses
duplicative of any possible mailing list we might establish.

Let me give you my vision of the PC for "everyham", including modest
DSP capabilities, and see how much interest it attracts (and how many
brickbats too, there are holes in these ideas).

First let me define a reference platform as a base for "everyham".
Faster and more elaborate platforms can participate too, of course,
but there has to be a floor below which we won't try to go simply
because performance becomes too limited. With that thought in mind,
here's my idea for the base system.

PC motherboard: 486DX4-100 minimum

Discussion: These are cheap, and about the lower limit for effective
PC DSP. A 586-133 might make a more reasonable base unit, and a P90
or faster would obviously work, but Pentiums are still more expensive
than most hams will devote to an amateur project. (That could change
in a matter of months, however. We have a rapidly moving target here.
We need to flog this out throughly before starting coding.) We shouldn't
make any of our code dependent on a particular processor clock rate,
so that it can painlessly migrate to faster hardware as prices fall,
but we do have to have some minimum rate below which we won't go.
I think the 100 MHz level is as low as we dare go.

Sound card: Generic Soundblaster "compatible"

Discussion: these are cheap and available everywhere. They aren't really clones of the real Soundblaster, and we will really only be using them for A/D and D/A to get the analog signals to digital form and back so we can process them. We don't want to tie ourselves to a specific brand or model of sound card because this too is a rapidly moving target. Example: the excellent Cardinal sound cards with the PSA chipset have virtually disappeared, dumping most of the coding work that has been done for them down the bit bucket. If we stick to a generic card used only for ADDA, we can avoid this obsolescence for quite a while longer, though we limit the ultimate performance we can achieve. A 44 kHz sample rate should be sufficient for anything we'll attempt to do with voice grade radios, and 16 bit sampling should be sufficient for our needs too.

Note that a second generation DSP plug-in card could be added for higher performance uses at a later date without obsoleting our PC platform as the control and display element of the system. We'd just add a driver stub to tie it to our standard API.

Memory: 16M base

Discussion: There are lots of 30 pin SIMMS floating around out there in the 1M and 4M range which we can acquire for a song, but motherboards that use them are becoming scarce as new product. We need to assume a 72 pin SIMM, and 16M is currently the most cost effective size. Why so much memory? Why not? It makes economic sense today. This is a moving target, but 16M is enough to run an effective OS and major application programs.

OS: Linux

Discussion: This is a hot potato. In one sense, a program loader like DOS has the advantage of getting out of the way and letting our DSP code run full throttle. But in another sense it isn't really cost effective to have a full PC just do a modem function, and a monolithic "do everything" program can become so large, clumsy, and intractably bugridden that it can kill the effort, so we need the ability to break the tasks into manageable segments with defined interfaces and multitask them. Windoze won't do, it is too clumsy and almost assures data loss and system crashes. We need a robust protected mode environment with a predictable scheduler. QNX might be ideal, but Linux is practically free, and is a completely open system (if we decide we need totally deterministic scheduling, we have the source code for the scheduler and can make it so). I think it is the ideal platform for *amateur* work. There are already a number of amateur radio applications running on Linux, and there is a robust software development environment available for it at no extra cost.

Development software: C++ with assembler boost

Discussion: We have the excellent GNU C++ and assembler available to us for no extra cost, these are the native tools of Linux

and most of the rest of the software world. We can do effective
DSP coding in C++ (with the critical sections committed to hand
tuned assembler following the 90/10 rule).

As a wildcard, let me suggest that the user interface should be Java
applets running in a browser. Java is rapidly becoming the "universal"
user interface language, and the browser paradigm appears to be the
next standard in user interfaces. This will make the learning curve
short, and will maximize portability.

I suggest we bury the DSP modem code and protocol code in a series
of driver and server processes and communicate with the browser applets
through a network standard API. This is clean, and allows us to migrate
to other platforms as they become affordable. This can also allow us to
implement client/server in a network transparent manner, allowing us to
run the DSP on one computer while operating it from another computer on
a local LAN (or even across the internet).

Now this sounds like a huge job, and it would be if we tried to do
it as a monolithic program, but we can break it into manageable pieces
in the Linux environment as long as everyone agrees on the APIs between
the various modules (and C++ tends to enforce that). Thus we can have
small teams each concentrate on their small piece of the project without
becoming overwhelmed.

The one thing we have to get right the first time is the overall
system design. If we choose the division of tasks and module interfaces
unwisely, we'll have an unmanagable mess that we'll never be able to
sort out. But if we do it right, we'll have a flexible and extensible
system which can serve us well far into the future.

>LO, right?

No. The diode DBMs actually work best with squarewave drive. The odd order
harmonics would pose a problem if we didn't have some sort of filtering
at the receiver antenna input, but standard lowpass band filters will
handle that nicely.

>I was thinking about a 2-30 MHz upconversion to 70 MHz and
>using an RF Micro Devices RF2711 which has the dividers on the device -

>I would think.

I worry about that. I'm afraid that there will be too much phase
jitter with the divider approach. I'll have to breadboard something
and see.

>Do you know anything about these RFMD parts?

No I don't. Do they have a web page?

>How about AD831 mixers?

Those I've seen. I'm using the passive MiniCircuits diode mixers
because I have a bunch of them and they are good enough for this
project. They're what Campbell used in the R2. A Gilbert cell mixer

does have advantages, however.

That's true, packet is a cooperative enterprise, you need to get at least
one other to upgrade with you or there is no benefit.

Gary,

Have you considered using a FPGA between the IF A/D, then following it with a more conventional DSP. Xilinx (and others) have DSP style processing macros that can handle in the range of 32 taps at 8 MHz (and more for the larger chips), by implementing the various multipliers as multiple logic blocks running in parallel. They cheat a little by making the multipliers for the particular taps your are looking for rather than making them "multiply by anything" multipliers - this requires a different compliation for different filters. If the FPGA is only used for the front end I/Q conversion to base band and some low pass filtering prior to decimation, this can work fairly well without too much of a hastle. The final demodulation is then done with the conventional DSP taking advantage of the flexibility of the processor. Just for a thought!

There was an article on a Baycom-style (TNC-less) packet system for the Macintosh in the October 1992 edition of the American magazine "73". It was written by someone called Dexter Francis, call KD6CMT, who gave his Internet address at the time as Francis4@Apple.com, or Compu Serve 70611,1340. Perhaps these addresses are still usable, or maybe a Web search on his call sign or the topics "Macintosh packet radio" would turn up the current version of the software mentioned in the article.

I'm not sure if your Powerbook 5300 still uses 68000-family CPU or not.

From: dave@hh.sbay.org
Message-ID: <5b6poj$pjn@moe.relay.net>
Source record: 32488

After a couple evenings hacking about with this
stuff, I think I finally got it right... the software isn't
ready for prime time yet, meaning it still may have some
bugs but here is a URL that you can check out for yourself.

http://www.relay.net/hffax/

The software runs on Linux. You plug your HF receiver
into your 8-bit sound card and run it. Out comes complete fax
pictures, just as you see here. I use as external programs,
the "vrec" utility (from vrec/vplay, part of the snd-utils),
and the "sox" utility for bandpass filtering of the audio,
prior to FM demodulation. My code just FM demodulates, and
makes pictures out of that.

When the fax signals are strong, the pictures look great.
Any noisiness is only because of fading and poor reception.

I sysop a packet BBS here in Borger, Texas. We are just a small spot, almost at the end of the road so far as packet messeges are concerned. However, in 1996 the BBS handled over 28,000 pieces of traffic. Over the last couple of days it has been running 300 messages a day, from just two forwarding partners.

I agree that e-mail has a lot of advantages, but see nothing from this side of things to make me think packet is dying out.

Have a great weekend. It is COLD in the Texas panhandle. Looking for a high of 6 on Sunday.

You might try the Telebit Trailblazer for this. They worked well
on satellite links at up to 19.2 kb. They used a proprietary
protocol which was only quasi-duplex, and which worked very well
against circuits without echo cancelling. You'd need one at each
end of course. Since the advent of the 28.8 kb standard, lots
of these have shown up on the used market very cheap.

Don't bother getting into it now.

In the Ct area packet is DEAD. It died a slow and terrible death of ignorance. Actually, packet has been dead for about 4 or 5 years now but many of the locals here just refused to bury it. It's sad to see such a young and underdeveloped mode croak. Here in Ct the real hi-tech nodes were almost running 2400 baud/half duplex! Oh WOW! (ah, well, not reliably, but 1200 baud worked most of the time..)

The really sad thing is the sorry bbs ops. It will take another 10 years before all those @wwbbs messages to stop circulating around. Many of those guys actually think packet still has live users! Sad, very sad...

If the audio level is too low, you don't need a 1:1 transformer,
you need a step up transformer. A 600:10k audio transformer should
do it.

>The same question goes for 9600 operation, since I will be getting
>around to it in the near future.

You can't do 9600 through the data port of the FT736R. Check out
G3RUH's mod for this radio. It is on most of the common mod sites.

You're way off the mark here, Charles. Packet networking is by nature
a cooperative enterprise. And 9600 certainly is feasible, affordable,
and legal on 2m, and represents an 8x improvement over 1200 baud. Rick
is correct that the primary impediment to improvement is inertia by
present users. High speed options do require moving off 2m, but again
it must be a cooperative effort. Solo activity is pointless. Having
the only 56 kb station in town gains you nothing.

>> Those of us who realized what could happen were made to understand that

>your arrogant opinions on down the road. Wish I'd been there.

In addition to being off the mark, you don't read well Charles. Notice
again where Rick said that he raised these issues *a number of years ago*,
IE *before* he left packet activity. I can certainly understand his
discouragement. Packet ops were resistant to improvements several years
ago, *and they still are*. Meanwhile, amateur packet has fallen further
and further behind the wired networks it once led. Yet that doesn't have
to be so. We have the technology to do better. It is resistance to that
technology, IE ignorance, fear, and the arrogance *you* demonstrate, among
many current packet operators which is holding us back.

1200 baud operation should have been dead and buried 15 years ago,
yet it is still in many areas the epitome of packet operation. That's
not only absurdly backward, it is a condemnation of those who should
know better who have maintained its use through the sort of bullying
Rick complains about, and that you've displayed here.

Yeah, I'm aware of what TC is doing. I want to do it with this
cheaper GPS that I already have. I don't really care what time
it is, I just need a stable common reference for receivers and
transmitters located remotely from each other.

>How precise does your time need to be?

At least 1 part in 10^-8.

>Do you need "real" time or just a very precise clock which is not
>necessarily synchronized with "real" time.

I don't need any particular relationship with GMT, but I do need
for several units to have the *same* timing within about 1 part
in 10^-8 of *each other* for periods on the order of several hundred
seconds. So I need synchronization and reasonable stability. If that
can be from "real" time, Ok, otherwise some other common "tick" is
needed to get them in step.

>What device will use the time?

This is for a coherent receiver/transmitter pair. What I want is
to use GPS as a reference for each of them, located in different
places, so that the signals generated by the transmitter will be
in step with the decoding done in the receiver. I can deal with
offsets as long as they are relatively constant. I don't want the
receiver to have to recover this clocking information from the
transmitter's signal since I expect that to be well buried in noise.
Thus I want a common external reference, and I figure GPS may be
able to provide that.

199. help:MFJ-1274 not working

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-11 00:00:00 UTC
From: hartzeld@cc.sdstate.edu
Message-ID: <5b9233$bra3@rc.sdstate.edu>
Source record: 32499

I've been pulling my hair out the last few days trying to get my MFJ-1274 TNC-2 to work. It has the 1.2.9 rev of the software.

I really don't know what's wrong. What happens is this. I turn it on, and it comes up fine. I set the configration of the TNC with the commands, including mycall, txdelay, mailbox on/off fine. Everything appears normal. All communications between my dumb terminal and the TNC work well, until I enter the converse mode. Up till this point I have been able to key my transmiter fine, and packets appear to be going out, until after I connect to someone. Then nothing happens.

I can connect to the local BBS fine, and after I have connected, the local BBS asks my name, and I press enter. Nothing happens. I can type away, and when I press enter, nothing happens. Pressing Control-C does get me back to the CMD: prompt, and from there operation returns to normal.

Also I noticed that when I enter the Sysop command to send mail to myself or someone, I also have the lack of response. I get the screen saying what I can do, how many bytes free, etc, but I can't even get the help screen to come up, and I can't even log out by pressing the B command.

When I first got the modem (used) I was able to mail messages to myself. The TNC seems to connect fine to other TNC's, just nothing happens after that.

If anyone knows anything about these boxes, let me know. I'd be happy to call you or email or whatever. Is there a self-diagnostic? All +/- 5v seem to be ok

Thanks.

Dave Hartzell -N0TGD

>A telephone call today to Kantronics confirmed this.

This is not a KAM issue, it is an AX.25 issue.
The AX.25 protocol was defined to use only a 6-character callsign
field plus a numeric SSID (a number ranging 0-15) back in 1984. The
rationale was that "no amateur callsign is longer than 6 characters".

Of course this was wrong, and later a proposal was made for a new
version of AX.25 that would have more flexibility. But by then, there
already were so many users that a change had no chance of being
accepted. We seem to be stuck with it.

I think I've figured out that the manual and schematic for the data in/out jack is wrong about the connections to tip and ring. While I have 1200 packet working, I'm not sure I need the isolation transformers.

Hello!

I have connected two TheNet nodes with a RS232 cable, and it works
just fine. I would like to add one more node, and according to the
TheNet documents I can do this if I make a special cable with a few
diodes. Ok, no problem. The question is that the third node is X1J sw.
Do they use the same protocol, or do I need the same sw in all nodes?

210. Help:AEA Log windows Broke

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-12 00:00:00 UTC
From: Bob Wilson <n2dvq@cyburban.com>
Message-ID: <32D993AC.5F8D@cyburban.com>
Source record: 32413

I have been using my 386 running (4 meg ram) Windows 3.11 to run Log Windows for about a year with no problems. About 2 months ago The field boxes and the data that goes inside stopped appearing at boot-up. At first just restaring windows seemed to work but in a few weeks it progressivly got worse needing several retries before it would work. Now its at the point where it comes up with only the field names, no data or data boxes, no matter what I do.

I have tried uninstalling and reinstalling the program. I also reloaded windows. I just deleated windows and reloaded the same version I didnt try an uninstall , Do I need to???

I also checked the DLL file dates from the original against the ones on the hard drive and looked for duplicates. I could find none. The computer is used only for radio stuff so no new apps have been added for a long while

I dont know what else to try, and AEA is gone so ....

Tnx for any advice.

I need the documentation, schematics, user manuals etc for a Tiny 2 TNC. I have been using one on a remote node for forwarding. Well while it was attached to a MOCOM 70 things were just great. Then the radio died and we have since tried to use a newer solid state ham band radio. The deviation was about 2 khz on the MOCOM and 7.2 on the Alinco. Which makes since considering the differences of impedance in the input circuits. Well the TNC owner before me "doctored" the circuit board a bit and I have no documentation. Can someone come to the rescue? I will take whatever info I can get and I will pay for copies. Thanks.

Is there a way to use Logwindows 3.02 with a telnet node as its
cluster connection? I'm on the AC4ET node (207.98.193.11) right
now on a Win95 system using telnet.exe via a PPP DUN connection
on COM1. Slick, except that logwindows doesn't know that it's there...

I'm looking at it with a monochrome monitor on my old 396 lap top
and while it looses something in the translation, it is still fun.
i.e. monochrome in fine. You'll have to check with the aprsSIG on
the tapr site about the baycomm modem. Sign up for 20+ emails per
on www.tapr.org.

Good luck and 73,

>the callsign.
>
>Thanks in advance.

Hi All.

I think the crux of this problem, which seems to be cropping up more frequently, is the limitation in the original AX.25 protocol. AX.25 only allows 6 characters in an address (callsign) and an SSID of four bits (0 - 16 dec.). In the AX.25 protocol document dated October 1984, section 2.2.13.2 outlines this limitation. This holds for calls and aliases.

The other half of this problem is that TNC manufacturers have used the same limitation in their multi-mode models when no official callsign spec exists for RTTY. AMTOR uses the 4 character Selcall and PacTOR uses the 6 character amateur call (although more might be allowed). Interestingly, software written for TNCs like the Gold program also have this limitation.

Currently, the only way around the problem is to use a beacon or some other text while using a regular callsign. That way other stations can still count the QSO.

No doubt, I think the AX.25 protocol needs to be extended to allow longer calls such as special event calls. I know this will require a re-write of nearly all the software and firmware, so there would be a big fight over changing it. So I guess ham radio is simply resigned to staying in the past and not moving forward...But, I digress. 12 and 1/2 years after implementation, the AX.25 protocol has seen no change despite glaring deficiencies. It is time the protocol were looked at to bring it into the '90s and position it for the 21st century, if we are to continue to use it.

That is all I have...

Release Notes - IM/Mac 1.0b28g

Written by Ivo Van Ursel, ON1XK
Copyright (c) 1991-1997, Ivo Van Ursel

IM/Mac is copyrighted freeware software. Copies of IM/Mac may be freely distributed for non-commercial purposes, provided copies of this Release Notes file and IM/Mac are included together in unmodified form. Commercial distribution, including distribution on compilation CD-ROMs, must be done under license.

- In previous versions, typing command-D and command-U rapidly in sequence with an Inbound Message window in front could leave the Inbound Mail window unrefreshed for considerable time.

- An 'alias' file which didn't end in a carriage return could result in a crash when mail was sent using the last entry.

- Some code changes to accomodate the 'Aaron' extension.

- The lower of the two small horizontal lines that separate icons and buttons from the text did not always update properly.

- A crash resulted when sending mail to an address ending in '@'.

- New icons for locked and deleted mail.

- When bouncing mail, the second line of the '.wrk' file contains now a full path.

- Forgot to remove the AppleEvent 'special handler' before quitting.

- Zooming or growing the Outbound Mail window reduced the horizontal scrollbar's reach with 36 characters.

- Added an ellipsis character when strings overflow field width in the Outbound Mail window.

- Scrollbars lost their help balloons with version 1.028f.

- The cursor was left spinning when a memory low alert shows.

- Increased the preferred memory size to 540k.

- Added a touch of color.

- Made it compile with 'MW C/C++ 68K 1.4' and corrected flagged errors. IM/Mac's source code is not yet fully compatible with MetroWerks CodeWarrior 8 since the BinHex function was implemented in 68k in-line assembler.

- Added in 1.0f28f but it did not work under System 6.0.4: "Added an option to delete a file when sent".

- Incorrect window hilighting when switching IM/Mac from foreground to background and vice versa while the clipboard window is open.

- When the clipboard window was sent to the background a slight flicker occured.

- The progress bar showing while decoding a BinHex coded message did not fill as smooth as indented. It now uses a color pattern when available.

- Added a progress bar while encoding BinHex. It will show for each outbound '.txt' file made.

- While reading the mail file it was not locked, which is needed to prevent NET/Mac from updating it, resulting in that message being returned to the sender.

- Found another bug in the 'alias' scanning code. Do not type a space in the middle of an address.

- Added some color information to dialog boxes.

- Try option-click and command-click on 'About IM/Mac'. This code has been there since ages but not many were aware of it.

- The application icon has more color. Rebuild your desktop to see the difference.

- Removed a slight flicker around the arrows of the horizontal scrollbar which showed when clicking inside a text window.

- First implementation of Drag & Drop: 'TEXT' files and 'TEXT' clipping files can be dropped into the Message Entry Window. You can also drag and drop any text from a Drag Manager aware application into the Message Entry Window: try it with SimpleText.

- Removed eWorld account information from help window.

- Implemented a color beachball cursor.

- A subject line longer than 79 characters could crash IM/Mac.

- 'Print', 'Send' and 'Reply' buttons are now 3D.

- Added command-period cursor when printing.

- 'TEXT' files with a resource fork are now stuffed and BinHex coded to preserve their resource forks.

- An outbound message no longer has the 'Decode' menu item enabled when it is over 32k in length.

- Balloon help did not take into account the vertical scrolling of the Inbound Mail window.

- Zooming the Outbound Mail window did not take into account the position of the vertical scrolbar: scrolled messages came not into view.

- Removed AppleLink account and updated Internet account.

- Using Aladdin's 'SITEngineLib b1i1' for stuffing files. BinHex will follow soon. Unstuff will follow as soon as I get the newer version that corrects a bug in the library.

- Checked compiling with MetroWerks CodeWarrior Gold 9 and 10.

- Added Begin Transaction and End Transaction AppleEvents.

- Crashed on Power Macintosh when using certain type of AppleEvents.

Thursday, January 9, 1997 - 18:57:55 UTC

PS (by PA2AGA)

This version obsoletes all versions of info-mac/comm/radio-im-mac in the Sumex-Aim.stanford.edu archives.

The new IM/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft

226. Linux and AX25: why a TNC ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-13 00:00:00 UTC
From: skubi@rodin.inria.fr
Message-ID: <5be0ad$m31@news-rocq.inria.fr>
Source record: 32428
Cross-posted to: comp.os.linux.networking,rec.radio.amateur.digital.misc

I don't understand what purpose a TNC serves when we do AX.25 with Linux.

I understand that a Linux box is needed, a modem is needed (and might be connected to the Linux box through a serial line), and a two-way radio is needed. But why the TNC ? What sense does it make ?

Marcin, F8AQR.

227. IC2350 commutation time

That's what I meant. If I want a 2-30 RX then I must either switch
front-end filters with DC or upconvert SuperHet.

> >I was thinking about a 2-30 MHz upconversion to 70 MHz and

http://www.rfmd.com

They claim their parts are for I/Q at this kind of frequency and
monolithic should have advantages.

> >How about AD831 mixers?

The 3rd order intercept on AD831's is pretty good with very low LO
drive. Also, they have an IF output stage which substantially reduces
the IF input matching issues.

> Marcin, F8AQR.
A TNC is basically a modem, it takes the tones from the radio and
converts them to RS232 also takes RS232 input from the PC serial port
and converts them into tones and a PTT signal to send to the radio. If
you have msdog or windoze and a packet program, likewise you need the
TNC for the same reasons. The radio can't handle RS232 signals direct,
the TNC gets its input from the phone/speaker terminals/socket and the
stuff going out goes to the microphone socket.

>full, now I hear only 3-4 stations after listening for hours. What's

>happened to packet while I was gone?

>--

Unlucky you... you'd better live here in YU where the packet community

is growing up every day. Unfortunately, most of them are not likely to

spend a single coin to improve the slow-train network (majority 1200bps

with some links at 2400/4800 bps) but rather shouting to the poor sysop

not offering better service that he's "responsible" for.

>From: bill@cs.uofs.edu (Bill Gunshannon)

>Subject: Kansas City Packet---What happened?

>that survived.

Well, I can figure... all these folks running nodes/bbs's seem to be

and remain ham radio amateurs ie people interested in some experimenting,

building, soldering, wiring etc. I would not expect from those casual
"internet amateurs" seeking for ready-made infos to be interested in
a slow-train net, particularly not to build or run hard/software and
improve there technical knowledge this way. I also have FREE e-mail
at two universities here (in Novi Sad and in Belgrade) at the high
speed, but I usualy feel much better using bbs (actualy one on VHF and
the other on HF, soon another one on HF) where a part of my own shack
is involved. Btw, is there any tcpip software developed for VAX/VMS?
At the local university they moved from VAX to PC/Linux equipment. If
they allow me to experiment with tcpip via radio, I'd like to use this
retired VAX. So, any info is welcomed.
>From: Mike Watson <crucis@sky.net>

I can't believe... I still keep trying to open more and more RF ports
at bbs's around in order to forward as much mail as possible. There's
still a number of bulls coming from *.USA.NA or *.USA.NOAM boards.
>From: dj1@prairie.lakes.com (Sean R Stepanek)

Err, if you do not know where to throw away your "dead" VHF/UHF nodes,
pse be our sponsors, :-) , I personally would not mind that. There is
also 28.8+ bps internet here, but I prefere ax.25 when talk to hams.
Well, I'm serious now, I'm afraid that next major WARC might think abt
hams and their wasted bands. Dr Davidoff's great book "Satellite..."

also says so.

I would like to know how you have sponsored your network (not only in FL)?

I suppose your income might be bigger than it is in my area, so it should

be easier to finance some improvements. Are there only individuals involved

or some sig's or clubs etc? Congrats on your IBM AT solution! Why not? I

was using an IBM XT clone with FBB 5.14 on HF until the last summer. Not

sure but think it was the last one in the whole Europe with 5.14 running.

So what? What to say about an old FT-7B rig with dipole ant 5m above the

ground? Most of it works right now. Only the XT gone to AT with 1MB of RAM.

Not quite sure, but hope it's ham radio spirit.

For 1 part in 10^8, you'll have to go to TC's approach, probably.
Most commercial GPS receivers will give 10^6 window on ticks, if
my memory serves me correctly, but as TC points out in the earlier stuff,
you've got both the jitter of the receiver's 1pps output to contend
with, and the possibility of 2 locations using a different set of birds,
which [may be my misconception, so please forgive] could result in a
different tick time outside the window.

Radio paging simulcast sites have adopted this general technique, but
a microsecond is more than good enough for most....

From: cruff@ncar.ucar.edu
Message-ID: <5beqn8$esa@ncar.ucar.edu>
Source record: 32444

Has anyone successfully gotten their DSP-232 to use a SmartWatch like
the manual says? I bought a DS1216C and installed it under U5 (one
of the EPROMs) like the manual says, powered up and set the date and time.
However, the date was not remembered across the power down/up. I also
tried U4 with no success.

Also, has anyone gotten the firmware update that includes the satellite
modems? I'm about to try calling AEA, but I've seen on the net that
they are not likely to have an operational customer service department.

243. Schematic for Poor Man's Packet modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-13 00:00:00 UTC
From: tswisher@freenet.columbus.oh.us
Message-ID: <5bdrs9$kho@login.freenet.columbus.oh.us>
Source record: 32445

Anybody got a copy of the schematic for the Poor Man's Packet modem which appeared in (I think) the August 1991 issue of 73? I'd like to give it a try and need the schematic.

Thanks,

Tom N8GQK

I believe you can still FAX AEA at (206) 775-2340. Contrary to what you may
have read here on Internet there are still people there. I think you will
find you can buy a manual for $25.00 plus $5.50 for shipping.

How about using a digital down conversion chip like Harris HSP50016

http://www.semi.harris.com/datasheets/dsp/dsp_family.html#Down
Conversion and Demodulation

"☐ 75 MSPS Input Data Rate ☐ 16-Bit Data Input; Offset Binary or 2's
Compliment Format ☐ Spurious Free Dynamic Range Through Modulator >102dB
☐ Frequency Selectivity: <0.006Hz ☐ Identical Lowpass Filters for I and
Q ☐ Passband Ripple: <0.04dB ☐ Stopband Attenuation: >104dB ☐ Filter
-3dB to -102dB Shape Factor: <1.5 ☐ Decimation from 64 to 131,072 ☐ IEEE
1149.1 Test Access Port ☐ HSP50016-EV Evaluation Board Available

The Digital Down Converter (DDC) is a single chip synthesizer, quadrature mixer and lowpass filter. Its input data is a sampled data stream of up to 16 bits in width and up to a 75 MSPS data rate. The DDC performs down conversion, narrowband low pass filtering and decimation to produce a baseband signal.
The internal synthesizer can produce a variety of signal formats. They are: CW, frequency hopped, linear FM up chirp, and linear FM down chirp. The complex result of the modulation process is lowpass filtered and decimated with identical real filters in the in-phase (I) and quadrature (Q) processing chains. Lowpass filtering is accomplished via a high decimation filter (HDF) followed by a fixed finite impulse response (FIR) filter."

or Graychip's GC1101A
http://www.graychip.com/GC1011A/GC1011A.html

"Fabricated in 1 micron CMOS technology, the GC1011A chip is an all digital receiver which can extract narrow band signals from wide band digitized sources. At full rate operation (70 MHz input rate), the input bandwidth can be up to 35 MHz wide. Any signal within the input bandwidth can be down-converted to zero frequency, low pass filtered, and output at a reduced sample rate. The narrow band output can be formatted as either a complex data stream, or a real data stream. In the complex output mode the output sample rate ranges from (1/64)th to (1/65,536)th of the input rate in steps of (1/4N) where N is an integer ranging from 16 to 16,384. The output sample rate is doubled in the real output mode. The user may select a standard output filter which has a passband covering 80% of the output bandwidth and has more than 70 dB of out-of-band rejection, or a wider, 90% passband filter which has 50 dB of out-of-band rejection."

Just a thought...

Ah, well, scrap that idea then. Looks like I'm back to TVRO receivers and locking the master oscillator references of the rigs to the colorburst of a signal on a transponder. That'll keep everyone locked together to the degree I need (I don't care about an absolute reference, just a relative one), though I'll have to do site by site doppler correction because geostationary sats really aren't geostationary and the doppler seen at any given moment depends on the ground station latitude and longitude. I was hoping GPS could get me away from needing dishes, thus allowing easy portable and mobile operation.

>-be

Amplifying on that thought, you will have to buy a 9600 baud daughter
card modem for the TNC2 to upgrade it to 9600. But at least with the
TNC2 you *can* buy such an upgrade board. With Kantronics 1200 baud
TNCs, you can't. It's sort of like the difference between a PC and a
Mac, the open architecture of the TNC2, and clones, with its modem
disconnect header, has spawned a third party industry for add in modems.
The closed Kantronics architecture doesn't allow that. (The exception
is the Data Engine from Kantronics, which *will* accept daughter
card modems, but that's serious overkill for someone starting out.)

Getting a TNC2 (or clone) is a good way to start out, especially if
you can get it cheap. However, another cheap alternative is Baycom.
For 1200 baud use, it'll work about as well as the TNC2, and costs
less (new). Baycom uses a single chip modem, often built into a RS-232
connector hood, and software on the PC to emulate the TNC function.
The only caveat is that you'll have difficulty making it function
under Windows. If you're running DOS, you're home free, and if you're
running Linux, you're Ok too, but trying to run Baycom under Windows
(and Windows 95) will be a major headache a beginner doesn't need.
An external TNC, like the TNC2, will work with any computer with a
serial port and a terminal program, including Windows PCs, or a
Mac.

250. DX PacketCluster network thriving!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-14 00:00:00 UTC
From: Ron Stordahl <ron@digikey.com>
Message-ID: <01bc0247$1a1a5c40$792010ac@stordahl.bus.dkc.com>
Source record: 32358

The BBS packet application is deteriorating in Northern Minnesota as well. I believe the vastly superior characteristics of the Internet may well be the cause.

However PacketCluster is thriving. The difference is that a PacketCluster user usually remains connected 24 hours/day to the cluster, and can tolerate 1200 baud 2 meter packet performance. The bulk of the traffic are DX spots, which are just a single line and they occur with low frequency on the average. Yes there are Internet packet cluster options, but they are too expensive in that a user would have to get a separate phone line and stay connected to his Internet provider 24 hours per day to get the same service he can currently on 2 meter packet.

Our network is actually growing in nodes and users.

Ron N5IN

The post mentioned a MODEM, a TNC is effectively a modem, you could not
use an ordinary modem for obvious reasons, but you need to MOdulate and
DEModulate a radio signal. Quite a number of cards BAYCOM and PA0HZP e.g
need a modem (G3RUH etc.).
You can put both radio and modem/TNC in a welded up biscuit tin,
relabel it and it'll do the business, just one way to achieve having the
cat's skin on your wall.
Saw some interesting topics in rec.radio.amateur.digital.misc about the
great possibilities of the new MMX chip for packet.

Was forgetting the soundmodem stuff in 2.1 as I am on 2.0.27, mainly
because the SCC driver refuses to compile at level I've so far seen. The
original post mentioned that he could see the need for a serial port and
radio, to that config you would need a TNC/Baycom modem.
The soundmodem is not an option if you are part of a 24/7 TCP/IP
network, so the par96/97 or USCC cards more fit the bill.

Hi Mark,

A lot of your questions are answered on the TAPR site where Glenn Elmore, one of the people behind the ARRL design has some links. Have a look at <http://www.tapr.org/~n6gn/> for some more details.

I'll have a crack at answering some of your questions anyway but don't profess to be an expert :)

> 1. What are "Gunn" (or Gunnplexer) transceivers?

A combination of a Gunn diode (which oscillates at microwave frequencies when appropriately biased) and a schottky diode which acts as a detector. The trick is in the design of the cavity which ensures that the reciever gets a certain amount of the transmitter signal - the TX thus forming a local oscillator of sorts for the reciever. I'll defer to the ARRL article for more detail etc. but you get the general idea.

> 2. What qualifies as "inexpensive"?

Glenn's page has some links to suppliers of such devices. Typical costs seem to be around the USD$50 mark.

Estimates suggest you could build one complete end of a 2Mbit microwave link for sub USD$300 or less depending on your junkbox/ingenuity/etc.

> 3. Where can I get them?

Checkout <http://www.shfmicro.com> as one source. I've not dealt with them myself but plan to shortly :)

> 4. Is this method worth learning more about (probably)?

IMHO, yes. 1200/4800/9600 baud are pretty naff by todays standards. Higher speed is not without it's drawbacks though, suddenly things like transmit/recieve switchover times become very significant for example. As a result, most multipoint designs use a central, frequency inverting repeater as a hub of sorts. The Ottawa group's page <http://hydra.carleton.ca/articles/hispeed.html> talks more about this. Alternatively (this is what a couple of us are kicking around in VK1) you run multiple point to point links, each site hosting two or more links to other users.

Again I defer to the references noted for more information

> 5. What do I need besides the transceiver, dish, pc, patience and
> knowledge?

Enthusiasm ? :)

Seriously though, we're fortunate enough to have some very experienced operators locally so for myself I'll be bugging them with questions. You'd more than likely find there are similarly knowledgable folk locally too.

Hope the forgoing is of some use,

Yes they will work just fine. I have a stack with 2.08 and X1J4
together and it works just fine. To the best of my knowledge all THENET
/ NETROM versions share the same communications protcol. Just make sure
you have the serial ports all set to the same speed.
Good luck and happy networking.

Hi Marcin.

It really makes no sense anymore with the creation of the Baycom style modems. Except for certain HF modes, TNCs are obsolete. The PC has now become platform of choice since it can handle the AX.25 chores while doing other tasks. It appears the future digital devices will be RF modems with Linux boxes handling all the network switching. JNOS will continue for the DOS platform, but my humble opinion tells me that as Linux gets more popular and hence easier to install and use hams will migrate in that direction.

Perhaps an indicator of TNC obsolensence is the recent demise of AEA, one of the primary TNC manufacturers in this country. Maybe someone can step to the fore with an amateur radio version of RF spread spectrum modems and that will be the future...for a while!

>
> Marcin, F8AQR.

It can unload the host from having to do the PAD function (Packet Assembly and Disassembly), as well as the channel management function. The latter usually isn't a big deal, but the former can be a substantial burden on a heavily loaded host. Of course if the machine is doing little else than just acting as a terminal program, there's no need for the hardware assist to unburden it.

The problem is that the bit stream coming from the modem is HDLC synchronous, and an ordinary serial port doesn't know how to deal with that. So the machine has to literally "bit bang" in and out using a status pin of the serial interface and software timing loops. All other activity on the PC pretty much has to halt during a packet send or receive.

(Baycom sets up the serial chip to generate timing interrupts so that the PC doesn't have to hang in a software timing loop for the duration of a packet, though it still has to bit bang. That's better, but interrupt latency in a multitasking OS starts to become a problem above 1200 baud.)

Another, and much better, solution is to use a hardware assist board *internal* to the host, such as the Ottawa PI2 card. That uses an 8530 to handle the synchronous HDLC, and DMA to move the data in and out of main memory. The PC is only interrupted once per packet. That works super, hugely better than bit banging, and much better than an external TNC hung off a serial port with an interrupt per character. There's a kernal driver for the PI2 in recent Linux distributions.

I don't have a PK-88, so I can't comment on AEA's recomended fix.
However, the fix I use on all sorts of TNCs should also work here.
That is to put a gimmick capacitor *directly* across the crystal.
If you aren't familiar with gimmick capacitors, they are made with
a couple of short pieces of insulated wire. Just solder one wire to
each crystal pad/lead on the circuit board then twist the leads together
until the crystal moves far enough off frequency to get the harmonic
out of your way. I usually use enamel insulated wire, but thermoplastic
insulated wire will work too, just takes more twists to get enough

capacitance (you only need a few pf directly across the crystal). Cut off the excess wire tails when you've moved the frequency far enough, and tape up the gimmick to keep it from untwisting. Costs nothing, works fine.

>
>Dave Hartzell -N0TGD

If you are using hardware flow control, make sure *all* the handshaking
lines are configured correctly, IE DTR, DSR, RTS, and CTS, or just switch
to software flow control as a test. As I recall, DSR changes state when
you connect, so this may be causing a hangup between your TNC and computer.
Also check the CONOK parameter to make sure it is ON. And check the Streams
parameter too. If that's gotten set to zero, you'd have the behavior you
describe.

The self-diagnostic for the hardware is the sign-on banner. If you're
getting that on power up, and you can issue commands in cmd mode, it is
unlikely that you have a hardware problem.

You don't need a TNC. The radio/modem can be attached directly to
a synchronous serial port (sorry, COM1 and COM2 can't do that :-) Sync
serial ports are provided on the PackeTwin, the PI2, the old DRSI, and
other cards. In fact, at higher speeds (9600 and up), the TNC just gets
in the way as a thruput bottleneck and should NOT be used.

Horse-Hockey! 9.6kb on 2m is a joke, since very few 2m radios are proper
for the job. You can do it - And you can put big tires on a VW beetle.. Big
tires and all, it will still be a bug. Let's stick with reality here.

Rick is full of farina when he says the big slowup is a shortfall on the
user's part. How typical of him to blame the users.
Fact is; The users are given very little choice. They buy what it widely
available, affordable and known to work with the existing local network.
The single largest impediment to high-speed packet is the socially retarded
antics of the HS advocates. Most of these clowns see no problem with
running down what other hams do, then expecting those same other hams to
look up to them. Morons.

Amateur packet never lead the wired networks. It never will. Think it
through.

Experimentors sometimes confuse "available technology" with "accessable
terchnology". Sure, you can buy a 56kb packert modem, but who will you
"talk" to?

I've owned 9.6kb modems for five years now, and have yet to find anyone
else interested in busting past 1.2kb. The experience has been frustrating,
but I have not turned to the HS packet neurosis where suddenly all other
hams are unworthy jerks, ect.

I'm perfectly capable of figuring that reasonable, decent hams can decide
that it is simply not interesting to them.
You can rant on about how stupid, shot-sighted, ect everybody on packet is
supposed to be...
I'll put my money on simple boredom, and the fact that obnoxious HS
advocates have managed to insult just about everybody by now, so the only
people who pay any attention to them any more are other HS advocates.
Everywhere HS freaks gather, you get to hear them parrot the same old lines
of crud to each other, talking about how stupid the great majority of
packet radio ops are, ect, to the point of nausea. Record five minutes of
it on tape, and you've got their entire broken-record philosophy down pat.

What a bunch of ignorant, obnoxious jerks!

> 1200 baud operation should have been dead and buried 15 years ago,

> know better who have maintained its use through the sort of bullying
> Rick complains about, and that you've displayed here.

Panty-waist !

A typical HS freak, you run the great majority of packet ops down every
time you open your mouth, but if anyone disagrees with your insulting crud,
they are "bullying" you.

Stick it, bud.

Hi,

I started this thread. Although I like most of what gary recommended, I would still insist on using a DSP based sound card (like the cardinal or orchid). DSP makes an incredible difference when it comes to weak signal recovery.

I'm willing to host a mailing list to start a discussion. Anyone interested?

: : Marcin, F8AQR.

Hi Marcin ,

It's very simple :

The modem is needed to make the radiointerface , converts the
zero's and one's into frequencies (AFSK).
As the name MOdulator/DEModulator.

But , where is the protocol !!! ???

The AX25 protocol or even another protocol it's in the TNC .

Example :
Baycom it's a modem without TNC , but the TNC it's emulated by
software . It really works but it's not the best solution !
A modem without a TNC has more errors and generates more interrupts
on the machine (PC).
If you use a baycom modem , the driver has to analyse all the input
data , even noise !

So the TNC it's needed , in one way or another !

There are some modems only with HDLC and rest it's emulated by
software , etc ....

well , I hope this helps (I got to practise my english) ... :)

Actually if you have a soundblaster 16, you don't need the TNC (modem)
at all. You can emulate a TNC via the sound card. It is really neat.

Just get kernel 2.1.17, and compile the soundmodem driver, and the sound
card driver as modules. Read the READMEs, and it makes a lot of sense.

Gary is right, we do not need a cheaper more powerful TNC, we need a mostly-
software replacement. It will gain _us_ the flexibility to continuously
improve things, rather than waiting around on the likes of AEA. And things
are headed that way already in the Linux community anyway; people are
discovering the alternative uses for those Soundblasters.

274. Re: Saw the DAMA comment (What is it?)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-14 00:00:00 UTC
From: Markus Lenggenhager <M.Lenggenhager@zrh.sc.philips.com>
Message-ID: <32DB34B3.2241@zrh.sc.philips.com>
Source record: 32452

Hi all

DAMA is a protocol where a "master" (the digipeater) polls one or more "slave" stations. As sysop of a dual-speed digi (1200 and 9600 Bd on the same frequency) I can confirm that DAMA is a very "democratic" protocol. It gives weak, distant stations the same chance as to the strong, nearby guys. With a dual-speed port, it prevents collisions because a 9600 Bd TNC does not "hear" 1200 Bd signals.
Even users who play with their parameters or run 4 parallel links do not get more throughput than others.
Of course there is some overhead, but the penalty is really low. Another problem during peak hours is to find a free "time slot" to connect to the digi as a new user. According to our experience, this can take 1-2 minutes, but once you're connected, you will get your share. By the way, the polling interval is adaptively controlled by the digi, based on a user's activity.
Sorry, I'm not a networking specialist, just wanted to give a short feedback from a sysop's perspective.

W3SAP ATV Station

P.C. Electronics TX70-1b transmitter
Spare parts kit for above (key semiconductors)
P.C. Electronics TVC-4G downconverter
Mirage D26 50 watt out amplifier
Panasonic WJ-MX 10 digital AV mixer
Panasonic WV-KB12A Character generator
Commadore model 1702 Video monitor
Sony CCD color camera
Cannon TV zoom lens 16-100 mm f1.9
Cosmicar 25mm f1:19 television lens
3 video switches
all necessary interconnect cables
Sony video converter
5 inch monitor/tv (for monitoring outgoing pictures)
AverKey3 SVGA to NCTB converter with wireless remote
Microphone
Halogen light
Manuals and paper work.
****
The above is to be sold as a package. To get on the air you need to have
is a color TV set, antenna, and 12-15 volt power
supply. I have over $2500 in the package -- will sell for $1200.

In addition the following could be made available.
2 KLM 444-16X beams with fiberglass stacking boom and power divider.
9913 coax and type n connectors
some hardline and connectors
YAESU G-450XL rotator and cable
******
In addition I am selling a 23cm (1296 MHz) ATV transmitter, amplifier,
and receivers, and beam. This ready to plug in and
play. E-mail me later for details on this outfit.
****
Reason for selling -- local repeater shut down. Questions? Contact me.

I have a GLEN custom 1600 for sale. It uses 4--4CX250R ceramic tubes. It
is
in PERFECT shape in all meanings of the word! If you havent heard of this
amp, I'll tell a little bit about it. The band-width on this unit is 40-2
meters.(about 7MHz through 145 MHz) It will take an input of about 4
watts-100 watts,(adjustable on rear of unit). It has an input on back for
direct key-up(re. footpedal). It runs on 120v ac. it has variable output(
kinda like the texas star 350 w/ variable). It has a built in watt meter,
that reads RMS, and is very accurate. The output is 1700 watts rms, 2700
watts peak, depending on how you drive it. This amp is beeing offered to
the
serious only. Not a scratch on it, no discolorings, no blemishes. very
PERFECT condition. Comes with origional paper work, schematics, and custom
slip/dust cover. Weighs about 90 pounds. 1800.00 + shipping, please dont
respond unless your serious,,, 73's, and happy modulating,, STRESS TEST.

Hello everyone,

I am setting up a BBS running FBB 5.15c software. I would like to use Baycom modems as I have been using them for a long time with TPK 1.82 without problems.

I use TFPCX 2.10 running on COM1 &2, the TFPCX sees both ports without a problem. Inside FBB both Baycoms are available but when I try to use 1 or 2 both PTT's are keyed at the same time. Can I use more than 1 Baycom and if so what am I doing wrong ?. If I configure only one, on COM1 or 2, it works fine.

Thanks for the help !

My question would be more on the silly side, sorry.

I read the HAM-HOWTO and AX25-HOWTO (whatever the exact names
of those FAQs are)... I'm trying to figure out what software
I need in order to:
- use my Linux laptop as a terminal for accessing
Packet VHF BBS via Baycom (hanging off the
serial port);
- use that laptop as a terminal for AMTOR, PACTOR
and RTTY via PK-232MBX on HF.

I may be stupid, but I couldn't figure out what tools are
available for that, nor how to put such a thing together.
Any help is appreciated. Please e-mail!

Thanks! [Oh, I have installed ax25-utilities, but that
package seems to be dealing only with IP over Packet.]

But, your'll find a specialized terminal program much easier to use in
that you can make selections from a menu rather than having to remember
commands. Sort of like the difference between using Windows or using
DOS. These programs work ONLY with the TNC's they were designed for.

With a totally dumb terminal you won't be able to send or receive files
either.

>> my dumb terminal and the TNC work well, until I enter the converse mode.

Another possibility is your parity/databits isn't set right. In
command mode, most TNCs ignore the 8th bit (since all commands are 7
bit characters, but in convers, the parity bit is checked. If you
press return with EVEN parity on your computer, the character
generated is not the "normal" $0D (sendpac) but instead is $8D. In
this case the TNC would not see the sendpac character and thus not
transmit.

Check the settings of PARITY, WORDLEN, 8BITCONV in both the computer
software and the TNC.

From: clarke@aztec.asu.edu
Message-ID: <5biqip$ltl@news.asu.edu>
Source record: 32387

I have downloaded APRS77C and cannot get it to work with my
MFJ-1278 TNC. When the program loads I get the message:
i/o glitch TNC not responding

I can re-load maps and program in my call and all that stuff. The
program tries to send the ID, etc.; but the TNC just isn't sending
the packet.

When I load the program, it asks which TNC I have and gives three
choices: AEA, PICO, TAPR. Well, none of those looks like MFJ!
I have been responding "TAPR". There are two initialization files
with the program called INITAEA.TNC & INITTAPR.TNC. There is
nothing about PICO (whatever that is) and nothing about MFJ.

If anyone is successfully using this combination, I would sure
like to hear from you.

HELP!!!!

>I don't know much about packet, infact I'm still waiting to purchase a TNC,
>but I was wondering if packet can use any terminal program, can you run a
>packet bbs off of any bbs software????

Sure, you can use any terminal program. I used Procomm for years, and Hyperterminal, which comes with Windows, will work too. Lots of Mac users like Red Ryder, and good old cu will work on a Unix box. A TNC expects a dumb terminal, so any terminal program which can emulate a dumb terminal will work fine.

Using any BBS program is more problematic. Most Unix BBSs will work if you make it the login shell on the line handling the TNC. Some DOS BBSs can be coerced into working. I don't know about Windows or Mac BBSs. But regular BBS software isn't setup to handle the sorts of things packet users expect, and usually doesn't understand message forwarding in the way other packet BBSs expect, so it really isn't a good idea in most cases. You should use BBS software written for packet so you'll be compatible with everyone else.

>
>What is APRS, btw?

APRS is the Automatic Position Reporting System. It takes location information from a GPS or Loran and transmits it as a packet. This is then plotted on map displays of APRS receiving stations. The sending station can encode the type of station it is, IE fixed, mobile, special service, etc, and that is displayed as an icon on the map. The sending station can also transmit direction finding bearings, and those are displayed on the map too. A station can also send one-line messages to other stations, that pops up in a window on the map.

It is used for such things as tracking balloons, DFing bad guys, or just seeing who's on the air and where they are. There are obvious uses for it in tracking resources at public service events, and it can also serve to show band openings, meteor scatter paths, etc. Some folks are also tying in their home Wx stations and transmitting Wx data that can be plotted on the map.

APRS uses UI broadcast packets, and they may be routed (manually) via digipeaters. In the US, there is a simplex network on 145.79 MHz devoted to APRS activities. This is a horribly inefficient system, using a system of flood routing based on digi alias' of WIDE, and the frequency chosen interferes with MIR communications on 145.80 MHz (due to +/- 10 kHz doppler on the MIR downlink during a pass), but it does work, and it is growing.

Again, this would be more efficient on a higher speed unified network with other applications like cluster and BBS forwarding, but that's not how it has evolved. This is a sore point with me. Every application seems to think it needs its own network, its own frequency, and of course its own network hardware and maintenance support. Things would be much better if all packet users would get together and support one unified higher performance network for their area which could handle *all* the various applications of packet simultaneously.

Many upconverting receivers still use switched band filters in the front end to avoid first mixer overload by strong out of band signals. So I don't think there's any hardware savings to this approach.

>Our network is actually growing in nodes and users.

You can say the same things about the APRS network, and add in the
fact that many of the stations may be mobile. It should be obvious
that a higher rate network would be even better for either application,
and could simultaneously support other applications, including a much
more functional BBS network, but 1200 baud does suffice at current
levels of activity for cluster and APRS uses if independent networks
are used. But that's inefficient. A single higher speed network could
service both needs while consuming less spectrum and consuming fewer
hardware and scarce maintenance resources.

The Motorola UT-Oncore gps receiver module outputs a 1pps signal with a maximum deviation from UTC of 130 ns. The receiver has a special 'position hold' mode for these purposes.

Some other gps modules have a maximum deviation (jitter) of 1ms. There are very big differences in these spec's. I don't know how the tripmate ranks in this scale..

Commercial gps-locked frequency standards have an stability of 10^-9, although i'm not sure how they deal with SA.

Is it just as bad as the ICOM IC2400 ? This transceiver, using close to 500ms for rx-tx turnaround, is even unusable in FM voice operating - producing 'doubling' (collisions) at the rush hour on our local frequency's, when the qso's are running untokenized...

Source record: 32397
Cross-posted to: rec.radio.amateur,rec.ham-radio,rec.radio.amateur.misc,rec.radio.amateur.digital.misc

The 1997 Orlando HamCation (SM) and Computer Show, sponsored by the
Orlando Amateur Radio Club, will be held on February 14, 15 and 16, in
Orlando, Florida. The Orlando HamCation is the second largest hamfest
in the southeastern U.S. with over 400 swap tables, 150+ commercial
exhibitors and the largest tailgate area in the southeast. We will have
many interesting and exciting forums/seminars/workshops. In addition,
the programmers and experts in APRSdos, WinAPRS, MacAPRS and JavAPRS
will be present to answer your questions.

For further information about the Orlando HamCation, please visit
the Orlando Amateur Radio Club's home page at:
http://www.cycat.com/users/oarc
or go directly to the HamCation URL at:
http://www.cycat.com/users/oarc/hamcat.htm

We hope to see you here in sunny Florida and that you will enjoy the
Orlando HamCation!

296. Using the Baycom BP-2M on CW

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-15 00:00:00 UTC
From: Rich Abbot <abbot@pez.bell-labs.com>
Message-ID: <32DD1E2C.3858@pez.bell-labs.com>
Source record: 32398

I just received my Tigertronics BP-2M, and I am now wiring the cables for it. I bought it for packet and RTTY use, but I'm also interested in its CW capability.

For CW operation, is the keying between the Baycom's PTT pin and ground pin?

For people who are already using the unit in this way, how does it perform on CW? Does it have any trouble keying modern solid state rigs? How well does it track the incoming CW signals? And is HamCom the only software that can be used for this purpose?

Thanks & 73,

Rich

299. Tiny-2 MK2 defect

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-15 00:00:00 UTC
From: Burt Lang <burt@rocler.qc.ca>
Message-ID: <32DCC342.5414@rocler.qc.ca>
Source record: 32401

Hi Folks.

During the repair of a number of PacComm Tiny-2 TNCs that were damaged by lightning, a manufacturing/design defect on the Tiny-2 MK2 model was discovered.

It would appear that EVERY PacComm Tiny-2 MK2 ever made has an electrolytic capacitor installed backwards. C23 is installed with the positive terminal connected to pin 6 on the MAX232. However pin 6 on the MAX232 is the NEGATIVE supply filter and output terminal with a typical voltage of -10v. If this capacitor fails, the charge pump voltage generation circuitry is loaded down and your serial port fails or locks up (or both). The only reason I can see that it has not been noticed before this is that PacComm have been generally using 25 volt electrolytics in this spot and they have been able to tolerate the reverse polarity under most normal circumstances.

The TNCs I was working on ranged from early production units with PCB ver 1.7 (SN 12,xxx) to pretty recent boards with ver 1.81 (SN 18,6xx) which had been stressed with lightning and it was during the troubleshooting procedure that my assistant started to ask why the board and the schematic did not match.

The schematic is correct and the board copper traces are fine if the capacitor is reversed (unless you consider that a square pad denotes the positive terminal). The only mistake the designer made was on the component layout screen printing where the polarity marking was reversed. Of course the board stuffers simply follow the board markings when the components are installed.

PacComm has been already advised by e-mail to their trouble reporting address. I am attaching a copy of the confirmation message received from their automatic server. At the time this message is being composed, I have not received any response from PacComm (I allowed 2 working days before posting this notice).

Recommended action:

This defect poses only a potential failure problem. If your TNC is working, you do not need to immediately change the capacitor. Schedule a change for the next time you have the unit open.

For network/node operators:
Examine your own node stacks when next servicing the node stack and replace C23 with a new unit (no telling what damage the existing unit has suffered with continued application of reversed voltage - although the units we switched around (we did not have replacements readily

available) seemed to work reasonably well). The replacement must be installed with the positive terminal in the hole nearest C33 (negative lead in the hole marked +). A dipped tantalum cap might be a better replacement.

Note: Some of the problems that I reported some years ago regarding low drive and lockup of the serial ports with certain brands of serial port ICs may have in fact been aggravated by this problem. I know of at least two stacks recently that have suffered similar problems with lockups.

Let's not dump on PacComm on this issue. Even the best manufacturers can have errors slip thru their design and testing procedure. We don't want another AEA - NetRom compatible TNCs are getting hard enough to find and we don't want a monopoly by one remaining manufacturer. What we should expect from a responsible company is correction of their current production ASAP and a timely advisory notice to owners outlining the problem and how it can be corrected.

Any Comments???

Burt>>>

Product: Tiny-2 Mk-2
Release: rev 1.7 & 1.81
Date:

SYNOPSIS:

Manufacturing/design defect in Tiny-2 MK2

DESCRIPTION:

You have a serious problem

Electrolytic capacitor C23 is installed with incorrect polarity on all Tiny-2 MK2 boards I have examined. The error is in the component marking screen printing on the board which obviously the installers used when orienting the parts on the board.

If you examine the board very carefully, you will find that the positive terminal of C23 goes to pin 6 on the MAX232 chip. However pin 6 on the MAX232 is the NEGATIVE polarity power supply filter point and output terminal and requires connection to the negative terminal of the capacitor.

The schematic is correct as is the copper traces on the board.

The problems arise when this capacitor starts to leak excessively and loads down the power supply circuitry in the MAX232. The serial port will then fail and may also lock up.

How come this was not noticed before this? Well probably because you have been using 25 volt units (instead of the 10v units specified in the schematic) and they tolerated reverse polarity at least long enough for the units to past inspection and during normal operation in the field. Users probably attributed occasional failures to other causes.

Recommended correction (on units already out in the field): Replace this capacitor with a new one installed with the polarity reversed to that shown on the board screening. I do not expect you to offer to correct them but I would expect you to issue an advisory notice to owners to warn them of the problem. I would also expect you to correct your production on future units asap.

Again I must emphasize that you generally make good products but bugs can be hidden in even the best of equipment.

HOW TO REPEAT PROBLEM:

Thank you for your interest in PacComm products.

PacComm

304. TCPIP: What To Do Next?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-16 00:00:00 UTC
From: ke7gh@primenet.COM
Message-ID: <01BC0349.A921ECC0@ip062.phx.primenet.com>
Source record: 32308

Well, I am back on TCPIP and this time full time.
I am running a Motorola Mitrek on 144.91 at 9k6
with an AEA PK-96. For now, JNOS is running as
a DOS window under Win95. I MAY try setting up
Linux at a later date on a different machine.

For those who keep track of such things, my IP
address is: 44.124.2.12

This is different than my original address, but I guess
some change was necessary for some good reason.

I keep the system going 24/7 now except for very
occasional shutdowns. I have logged into my internet
provider with it and it was fairly quick via telnet. But,
unfortunately, I don't feel comfortable sending my login
and password over the air.

My question, what USEFUL things can this setup do
for me? I'll admit it is a dumb question, but I'd really
like to know. I can access a node with wide range,
but don't know where to go or what to do from here.

Maybe someone could attempt to send me an email
via TCPIP radio? What do all of you others do with
your TCPIP setups?

73, Brian ke7gh@primenet.com

Tell us where we can buy a Cardinal or Orchid card with the PSA chipset.
I've had the local distributors looking for them with no luck. They all
had them at one time, but they seem to have disappeared from the market.
I strongly suggest that we not base a development effort around hardware
which is of dubious availability. We need a stable platform which will be
easily available for several years to come.

DSP is DSP whether we do it on dedicated hardware or on the main processor.
The PSA chipset gives us about 40 MIPS, but we can do that on the main
processor now. We don't need special unobtainium cards for most of the
DSP we would need to do. (Now exotic stuff still needs special hardware
acceleration, like the 56001 in the PTC II, but the PSA equipped sound
cards aren't in that league.)

Unfortunately, many of those "more modern" designs go crunch when
faced by strong out of band signals, such as a nearby BCB transmitter.

Under linux, we use a modified WAMPES by Darryl Miles (G7LED), author
of LBBS.
Main uses are mail, news and chat (sconvers also by G7LED), we
occasionally send shortish files (200K or so) via ftp, those who already
run 9k6 on 70cms will ftp files of over 1 Meg. From here I connect in to
GB7NJR who acts as my node out and also NNTP server.
In short we do all the internet things on here and we are hooked up
24/7 also. This was achieved by a number of us cooperating and coming up
with a structure for the network, others telnet in to me and join
sconvers, also one guy uses me as his node out, I now have to setup as
NNTP server for him so he can get his news from me.

With a DSP (software) approach you have the flexibility to continuously
improve things, but this flexibility is only theoretical.
To really do something, you need competent DSP software writers, and it
seems these are even less available in the amateur radio field than
competent hardware designers.
This has frustrated many DSP projects around the world: in the beginning
there is excitement about what this new board can do, then there appears
some software to do the things that we already could do in hardware
(e.g. G3RUH modem, AFSK modem), but when it comes to developing really
new things the progress is much, much slower.

Besides, we are trying to speedup packet beyond the point that is
reachable with commonly available DSPs and audio codecs, and thus it
will be even more difficult to be at the leading edge with DSP modems.

The medium-speed packet radio modems that are now popular (DSY 56kbps
modems in the States, speeded-up G3RUH FSK modems in Europe) are not
based on DSP technology (better: not based on general-purpose DSP with
custom software that could be modified for further improvement).

I think it would be unreasonable to require every existing TNC to
change firmware, and that's what it would take to extend the call
sign field of AX.25. What we really need is *new* link level protocols.
AX.25 has a number of warts due to the compromises made when it was
designed, and it was designed for an environment which has changed
radically since it was created. We don't need to try to patch it,
we need to move beyond it.

Because of its warts, IE compromises, AX.25 is able to be forced
into serving in situations where it is totally unsuited. It's the
old idea that when all you have is a hammer, everything looks like
a nail. What we need is to expand our toolbox to hold other protocols
better suited to the various environments we face.

To maintain interoperability at the application level, we need level
3 and 4 protocols sitting on top of our various link level protocols,
IE an *internet* protocol. Fortunately, we already have that in TCP/IP.
Under TCP/IP we need link level protocols suited to the individual
links we may have to span. One size does not fit all here. HF simplex
needs a different link level protocol than VHF simplex, and nets which
use duplex repeaters or simplex hub and spoke architectures need a
different link level protocol than non-contending point to point
links. These don't have to be the same even when we are spanning
several of them with a contact. It is the job of the individual
switches to negotiate a link level protocol between themselves
on a hop by hop basis, our messages should be at the higher
internet level where all that is transparent.

Using an embedded call sign field is only one of several ways we
can handle the link level addressing issue. It may be inefficient
in some cases, inadequate in others. The problem of IDing link
transmitters should really be considered a separate issue from
link addressing. Using Morse ID is probably not a good idea because

it is so slow. Perhaps what we should do is standardize on a universal ID packet of a certain form, and make sure all of our various flavors of link firmware know how to emit it periodically regardless of the actual link protocol we may be using on a particular link. If it is short, fast, and standard, it should satisfy the authorities (though we may need a minor rules change in some cases to ratify it) while not overly degrading traffic performance on the channel.

315. HamComm 3.0 "registration" by N9ZLE: a slap in my face!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-16 00:00:00 UTC
From: schroeder.pad@sni.de
Message-ID: <5bkrfb$5j9@linus.pdb.sni.de>
Source record: 32319
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc,rec.radio.shortwave,uk.radio.amateur

Hello netlanders,
while looking around on the web i came to this very interesting place:

http://www.concentric.net/~n9zle/hc.html

where Bruce C. Raisley, N9ZLE, offers HamComm interfaces.
Near the end of this web page you can find the following line:

"Register (fix) program for HamComm 3.0 only Not a true registration!"

Here you can download a small program REGHC which

PATCHES THE SHAREWARE VERSION OF HAMCOMM 3.0 !!

If you run the program it displays the following message:

--
This program removes the Unreg screen when exiting
the HamComm program. It does not register it.
debugger created by... N9ZLE
The dirty deed has been done..............!
--

Being the author of the HamComm software i have to say
that i am not amused at all. Removing the reminder message
from the shareware program will definitely reduce the number
of registrations.

It seems Mr Raisley has forgotten that he can only sell
interfaces because of the countless hours of work me and other
shareware authors have invested to create affordable programs.

--

I just had to learn that the same has been done to HamComm 3.1
by a hacker group (*not* by N9ZLE, maybe it was too difficult).

As a consequence of these unpleasant events i have decided that
there will be
NO SHAREWARWE VERSION AFTER HAMCOMM 3.1

Any new features will only be available in the registered program.

Many of the "more modern" upconversion receivers are using a simple
"roofing filter" ... a LP at say 32-35 MHz, followed by an upconversion,
then a bandpass filter (xtal at 45, 70, etc.), followed by either a down-
conversion to a (very) low IF or an I/Q mix to baseband.

I prefer the latter ... just going straight from RF to baseband has appeal
as well ... there are still advantages to both of these approaches, based
on the current limitations of various parts.

Yes, the RX-data of the Modem is not connected to RxD of the RS-232
and the RS232's TxD is not used for transmit-Data.

It is almost impossible to integrate this into any UNIX kernel. You do
need special Hardware for HDLC transmission. This can be either a
Z8[05]38 on an ISA board or the Z80SIO in the TNC conected to the
RS232 interface.

320. Re: If you can use any terminal software for Packet, what about....?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-17 00:00:00 UTC
From: interflex@msn.com
Message-ID: <00001fec+00001b7d@msn.com>
Source record: 32322

A simple terminal program considers the data as all belonging to one "stream" which on packet is not often the case.

Packet allows multiple sessions, including simultaneous monitoring of the channel activity.

Simple terminal programs mix all of the data together on the one screen available. If the user wishes to work multiple stations, and monitor channel activity, all simultaneously, what might work is

(1) IQ of 300 -- being able to sort packets into separate streams by thinking hard about it,

(2) high level of tolerance for confusion,

(3) make lots of connects, turn on simultaneous monitoring, and have several friends with you all watching the screen, each one "responsible" for certain frames, or

(4) use software designed for multiple sessions, separate screens, big scrollback buffers, etc., that make all of this easy.

In general, simple terminal programs reduce the multiple session capability of the TNC to that of a single session device. The TNCs are capable of much more. Once you've experienced multiple sessions, simultanous monitoring of channel activity, background file transfers on the same or a separate session, conference operation, etc., going back to a simple terminal program is not easy.

However, given all of this, there are many people running simple terminal programs who don't care about multiple sessions, monitoring simultaneously, etc., so it really depends on what you think might be interesting and useful. During emergencies, if packet is used, multiple sessions and monitoring are indespensible.

My BP2-M does fine on connects but only on occasion does it capture
text/info transmitted from the connected station. What has me going
is there's perfect copy in the monitor window but more often then not, my
station sends a reject to that and result is nothing in the message window.
This is on a DOS based machine, HTX202.

Now haven't found a lot of packet around here and this is based on experience with just
one node. I can connect to myself through that node and transmit text and have it
appear in the message window but its not a whole lot of fun talking to myself.
Have a lot of fooling around I can do, like swapping radios, improving antenna's,
checking other stations in other locations, but just thought I'd
check to see if any one else had this problem or an easy solution as who knows
when I'll get around to doing all that.

Tnx, Greg W5KJ g-taylor4@tamu.edu

"DESIGN DATABASES AND DRIVE MICROSOFT ACCESS"

Last year I taught a night school class which deal with
database design and the use of Microsoft Access.

The students were mainly business people wanting to make
practical use of either Access 2.0 or Access for Windows
95. Some students wanted to be able to manage hobbies or
sports organisations.

Their first problem was to design their database, then
they wanted it in action as quickly as possible. Existing
textbooks were expensive, did not deal with design, and
contained more than the basic essential information.

The notes I wrote as courses proceeded have
been compiled into a learning guide for those who want to
build a database quickly.

Should you be interested in a copy of the learning guide
"Design Databases and Drive Microsoft Access"
the cost is US $29.95, which includes package and postage.
Just send a cheque or credit card number, expiry date and name.
Do not forget your name and address for postal delivery.

My address is:

Robert Shaw
49 Sea Vista Drive
Pukerua Bay
Porirua City
NEW ZEALAND

Comments on the usefulness of the book are most welcome.

Hello All:

I have begun to experience a problem w/ my PK-96. It seems that it has begun emitting large amounts of Wideband RFI (enough to prevent my HT from recieving packet stations!). This started out slowly, but has grown to the point where the setup is currently useless as I can't hear anyone anymore.

I have noticed that If I unplug the data cable FROM THE TNC, the noise (on 145.61) dropps to s-2/s-4. Nothing else but turning off the tnc or disconnecting the radio's antenna will do anything

ANY help greatly appreacaited!!!

Try getting the OTHER station to extend its TXD setting. It sounds to
me like the familiar problem of getting a connect (a very short frame
and perhaps the easiest to decode) and then missing the connect MESSAGE
sent immediately after acknowledging the connect request from your
machine. Your tx to rx switching response time may be a bit slow too,
try such tricks as running your receiver with open squelch. Your text
seen in your monitor window may be attempts by the other sender to send
a packet frame, say #2, when your machine still has not received or
acknowledged reception of frame #1, which means you will see the
attempts in your monitor screen but cannot see it in your connect
receive screen.

>(e.g. G3RUH modem, AFSK modem), but when it comes to developing really
>new things the progress is much, much slower.

That's true, but what we're talking about here should accomplish some
useful things. Because it *doesn't* require an investment in special
one of a kind hardware, participation should be larger than for things
like the TAPR DSP card. The more people playing, the greater likelihood
that some of them will have real expertise (that's just simple population
statistics). Also, because special development tools aren't required for
hardware debugging, and because the base C++ compiler can be used for most
algorithms, learning how to do DSP programming should be easier, so more
people will gain the expertise that you (correctly) see as so lacking now.

>Besides, we are trying to speedup packet beyond the point that is
>reachable with commonly available DSPs and audio codecs, and thus it
>will be even more difficult to be at the leading edge with DSP modems.

The hardware base suggested is sufficient to achieve markedly better
performance than most available hardware solutions for *voice grade
radio* use, and likely better than some dedicated platform DSP solutions.
Speeding packet up beyond that requires special RF hardware, and in some
cases, requires regulatory relief. That's a worthwhile direction to go,
but it isn't the only direction where cutting edge improvements can be
made.

This shouldn't be looked upon as a method to achieve higher UHF+ packet
speed. This is intended to improve average performance in the low to very
low speed arenas, especially for weak and noisy signals, IE satellite, HF,

etc. The hardware base presented is sufficient to offer good opportunities in that area. Also, more mundanely, it can replace several hardware modems for the up to 9600 baud voice grade operations amateurs currently pursue. There is room to push the envelope at both ends of the speed spectrum. This approach is for the lower end of that spectrum.

>The medium-speed packet radio modems that are now popular (DSY 56kbps >modems in the States, speeded-up G3RUH FSK modems in Europe) are not >based on DSP technology (better: not based on general-purpose DSP with >custom software that could be modified for further improvement).

That's true. GP DSP hardware isn't up to that task on an amateur budget yet. It is still more cost effective to retain simpler modulations and codings using dedicated RF hardware. That will certainly change over time, but it is the wrong place to introduce large numbers of amateurs to the art of DSP coding because it *does* require specialized RF hardware. Fortunately, in the UHF+ spectrum where higher speeds are permitted, good non-fading SNRs are relatively the rule rather than the exception, and spectrum is relatively uncrowded so spectrally efficient modulations aren't so vital. Thus DSP is not needed nearly so much there as it is at lower frequencies and lower speeds where voice grade radios and audio rate coding can provide benefits.

The approach outlined uses totally *off the shelf* hardware, and that's important for several reasons. First, it doesn't add distraction and confusion to those attempting to concentrate on DSP coding improvements. It requires no exotic RF test gear. And it allows lots of people to participate without making a large investment in special purpose hardware which cannot be used for something else if they find DSP work not to their liking. This latter has restricted participation in many projects which required the purchase of specialized hardware. For example, I have what may be the only fully functional TAPR NNC in existence. Only a few people were willing to purchase the dedicated hardware, and fewer still were willing to do serious code development for it. Thus it died on the vine, even though for its era it offered lots of potential. TAPR's dedicated DSP card faces a similar fate.

330. $$$ CASH WITH YOUR PC - YOU MUST READ THIS $$$

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-18 00:00:00 UTC
From: <>
Message-ID: <joernall-1701972145580001@smithers-37.netshop.net>

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

$$$$ This is what many people call A $$ scam but, IT WORKS you can't lose!!!!!!$$$$

Take five minutes to read this and it WILL change your life.

The Internet has grown tremendously. It doubles in size every 4 months. think about it. You see those 'Make.Money.Fast' posts more and more. That's ... because it WORKS ! So I thought, all those new users might make it work. And I decided to try it out, a few months ago. Besides, whats $5.00!
So I sent in my money and posted.Everyone was calling it a scam, but there are SO many new users!

Well, two weeks later, I began recieving bucks in the mail! I couldn't believe it! Not just a little, I mean big bucks! At first only a few hundred dollars, then a week later, a couple of thousand, the By the end of the fourth week, I had recieved nearly $47,000.00. It came from all over the world. And every bit of it perfectly legal and on the up and up. I've been able to pay off all my bills and still had enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well. Markus Valppu says he made $57,883 in four weeks. Dave Manning claims he made $53,664 in the same amount of time. Dan Shepstone says it was only $17,000 for him. Do I know these folks? No, but when I read how they say they did it, it made sense to me. Enough sense that I'm taking this serious.

STEP 1.

Invest your $5 by writing your name and address on five seperate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST." (In this way, you're not just sending a dollar to someone; you're paying for a legitimate service.) Fold a $1 bill inside each paper, and mail them to the folowing adresses:

1-M Palmer Gilfach Goch,Blaenpenal,Aberystwyth
SY23 4TN ,United Kingdom

2-T.Toole box1138,Valemount B.C
Canada VOE-2ZO

3-Vitor Schlrder de Borba
Av Lucas de olivieira 2280 ap 404
90460-000 Porto Alegre/RS Brasil

4-Evert jan Benz
nijensteinheerd 58
9736 TD Groningen
Netherlands

5-J.J. Alles
RR 2 Site 81 Comp 6
Smithers, B.C.
V0J 2N0
Canada

STEP 2.

Now remove the top name from the list, and move the
other names up.This way, #5 becomes #4 and so on.
Put your name in as the fifth one on the list.

STEP 3.

Post the article to at least 250 newsgroups. There are at
least 19000 newsgroups at any given moment in time.
Try posting to as many newsgroups as you can. Remember
the more groups you post to, the more people will see your
article and send you cash!

STEP 4.

You are now in business for yourself, and should start seeing
returns within 7 to 14 days! Remember, the Internet is new
and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back 5 responses.
Yes, thats right,only 5. You make $5.00 in cash, not checks or
money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250
additional postings with your name at #4, 1000 postings. On
average then, 50 people will send you $1.00 with your name at
#4,....$50.00 in your pocket!

Now these 50 new people will make 250 postings each with your
name at #3 or 10,000 postings. Average return, 500 people= $500.
They make 250 postings each with your name at #2= 100,000
postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 250 postings each with your name at
#1 and you get a return of $60,000 before your name drops off
the list.And that's only if everyone down the line makes only 250
postings each! Your total income for this one cycle is $55,000.

From time to time when you see your name is no longer on the list,
you take the latest posting you can find and start all over again.

The end result depends on you. You must follow through
and repost this article everywhere you can think of.
The more postings you make, the more cash ends up in
your mailbox. It's too easy and too cheap to pass up!!!

So thats it. Pretty simple sounding stuff, huh? But believe me, it
works. There are millions of people surfing the net every day, all
day, all over the world. And 100,000 new people get on the net
every day. You know that, you've seen the stories in the paper.
So, my friend, read and follow the simple instructions and play
fair. Thats the key, and thats all there is to it. Print this out
right now so you can refer back to this article easily. Try to keep
an eye on all the postings you made to make sure everyone is
playing fairly. You know where your name should be.

If you're really not sure or still think this can't be
for real, then don't do it. But please print this article and pass
it along to someone you know who really needs the bucks, and see
what happens.
I've been perusing usenet for a few months now and I've seen these ads
appear very often. Like you, I thought that these postings were a
complete annoyance and a waste of time. But after reading dozens of them, I
decide 'For the sake of only 5 dollars I'll give it a try'. But the
reality is that it DOES work and you are guaranteed to receive large
sums of money, legally.
Make sure that you put your correct mailing address,
especially if you're from another country as some people have never sent
mail out of the country and might not know how. You may alter this
article
if necessary, editing what you need to edit.

REMEMBER....HONESTY IS THE BEST POLICY.YOU DON'T
NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS!
GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL
WIN AND MAKE SOME REAL INSTANT FREE CASH!

*** By the way, if you try to deceive people by posting the messages
with your name in the list and not sending the bucks to the people
already included, you will not get much. I know someone who did this
and only got about $150 (and that's after two months). Then he sent
the 5 bills, people added him to their lists, and in 4-5 weeks he had
over $10,000!

TRY IT AND YOU'LL BE HAPPY!!! :o) !!!!!!!!!!

INSTRUCTIONS ON HOW TO POST USING NETSCAPE 3.0

1. Click on any newsgroup like you usually would, then click on
"TO:NEWS" in upper right hand corner. This will bring up a message box
to type this article in.

2. Leave the message box like it is, don't maximize it. In Subject
box type something flashy like "$$$CASH READ HERE$$$".

3. Tab once and you are ready to type in the body of the box. Retype this article but with your name inserted in slot #5 and the others moved up as I directed. Remember the #1 in this article will be removed in yours.

S. Pypke tells people to retype the article. This may not be necessary. Try this: highlight the article with a mouse (or click edit and click select all). Then, click edit, click copy. Then, go to notepad, or Word, or WordPad, or Wordperfect. Click paste. Save it from there. To post, highlight from notepad. Click copy. Go to the mail section to post, click paste. Go on from there. This will make it easier.

4. When you are done retyping this whole article with the proper changes, click on FILE in this message box (it is right above SEND). Click on SAVE AS under FILE (make sure your in the newsgroup message window, not where it says Netscape News) Save your file as a text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO THIS!!! Once saved move to next step.

5. To post to at least 200 newsgroups do the following. You can post to more which will bring you more money but 200 is the bare minimum. Go to a newsgroup you want to post in. Click on "TO NEWS". Write your subject just like you did when you retypd this article. Hit tab once. Now click ATTACHMENT.
Another box comes up. Find your file where you saved it. Highlight the file and click "OPEN". Now click OK. If you did this right you should see the file name in the Attachments box in shaded letters.

6. NOW JUST CLICK SEND. Do this to at least 200 newsgroups (there are over 18,000) Each time it takes no more than 30 seconds so once you have retyped the article its easy.

INSRTRUCTIONS FOR EXPLORER

1. Holding down the left mouse button, highlight this article. Then press "CRTL" key and "C" at same time to copy this article.

2. Print this article for reference.

3. Go to Newsgroups and press "POST AN ARTICLE", a window will open. Type your headline in the subject area and click in the large window below.

4. Press "CRTL" and "V" and the article will be placed in the window. If you want to edit the article, do so and then highlight and copy it again. Now every time you want to post the article in a new newsgroup just do the "CRTL" and "V" command and press Post"

331. CD R MEDIA FOR SALE AT LOW PRICES

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-18 00:00:00 UTC
From: TCCS
Message-ID: <5bq6nn$6mh@mtinsc01-mgt.ops.worldnet.att.net>

We have the following CD-R media for sale.

Brand: Pioneer
Type: Printable Media (Surface is blank for printing or labels)
Type: Gold on Green
Size: 74 min (650 mb)
Price: 6.99
Minimum Order: 10

Brand: Pioneer
Type: Gold on Green
Size: 74 min (650 mb)
Price: 6.55
Minimum Order: 10

Brand: Maxell
Type: Gold on Gold
Size: 74 min (650 mb)
Price: 6.55
Minimum Order: 10

Brand: TDK
Type: Gold on Green
Size: 74 min (650 mb)
Price: 6.55
Minimum Order: 10

Brand: Hewlett Packard
Type Gold on Gold
Size: 74 min (650 mb)
Price: 7.15
Minimum Order: 10
Lifetime Warranty

The Copy Cat Shop has all your CD duplication, replication, recorders,
software, and media needs.

If you have any questions or comments feel free to call.

Cordially,

The Copy Cat Shop

332. Re: PK-96 emitting Wide-band noise

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-18 00:00:00 UTC
From: pa0lbn@anchor.nl
Message-ID: <pa0lbn.30.00021DB5@anchor.nl>
Source record: 32334

In article <5borfb$61s@ash.ridgecrest.ca.us> kusznir@lo-pan.ridgecrest.ca.us (Jim Kusznir) writes:

>Hello All:

>I have begun to experience a problem w/ my PK-96. It seems that it has
>begun emitting large amounts of Wideband RFI (enough to prevent my HT
>from recieving packet stations!). This started out slowly, but has
>grown to the point where the setup is currently useless as I can't hear
>anyone anymore.

>I have noticed that If I unplug the data cable FROM THE TNC, the noise
>(on 145.61) dropps to s-2/s-4. Nothing else but turning off the tnc or
>disconnecting the radio's antenna will do anything

I had a simmilar roblem on the HF bands with a DPK-2.
Noise was suppressed by winding a 25 wire flat cable on a
ferrite rod (ends of the cable had 25pin female and male connectors)
this was connected inbetween cable and tnc.

A good solution for v/uhf might be using a shielded cable and connectors.
Make sure that the shielding is connected to the chassis of the PK-96
and to the computer and that this groundwires are thick and short.
A number of windings of dc and af leads should be wound on a small
torroid close to the tnc.
Also decoupling of the pins of the RS232 connector in the PK-96
might help. Solder short wired ceramic 220pf C's between ground
and the pins that you use (? 234568 and 20)

>radio* use, and likely better than some dedicated platform DSP solutions.

How high data rates would be possible using unmodified voice grade
FM-radios on non-fading VHF/UHF paths between fixed stations ?

Is the audio really that bad compared to ordinary telephone lines,
where speeds over 30 kbit/s are possible. Yes, I know, the telephone
is full duplex and you can train the equalizer at the beginning of the
connection. Training the equalizer in packet radio is problematic, if
there are more than two stations on the frequency.

How about training the equalizer when the connection attempt is made.
During the handshake period, the stations could even agree what speed
to use. The equalizer coefficients would then be saved and the
equalizer would be reset to default settings. When the station sends a
packet, the first bytes would be transmitted at a low speed (say,
using standard AX.25 header at 1200 bit/s FSK). All stations could
copy these bytes with default equalizer settings. Based on the source
field (callsign) in the received header, each station would check if
it has equalizer settings for this station and modify the equalizer
accordingly. This would be faster than train the equalizer in each
transmitted with a long preamble. Of course, you still have to retrain
the equalizer if there are changes in the propagation path.

>73 de VE2UFO
>Don Lafontaine

Yes, Don, N9ZLE has an email address. He has a web page also. But before you jump off the deep end, maybe you should do some homework. I bought an interface from N9ZLE a few months ago, and it included a diskette with Hamcom 3.0 and another shareware program. The shareware notice had NOT been removed from the version I received.

As a programmer you should know that there always have been and always will be people who don't pay for software, regardless of if it's 'shareware' or 'buyware' or whatever. And unfortunatly there will always be software that people DO pay for that isn't worth the price of the diskettes it came on. Hence the term 'shelfware'.

I don't know N9ZLE personally, but I see absolutely nothing wrong with what I got from him, software or hardware wise. And I would like to add his service was excellent.

AEA sent out all of the upgrade EPROMs in early December. Apparently there was a problem with some of the upgrades because some people report that the upgrade set of EPROMs did not work at all (dead TNC). Others report a vast improvement.

At this point in time I think you are stuck because AEA is no longer functional. The TNC product line has been sold and the buyer of the line will honor AEA's warranty. I assume you will be able to get your upgrade from them. I believe the buyer will be announced during February.

342. help:MFJ-1274 not working

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-18 00:00:00 UTC
From: aa5mt@gate.kc5aug.ampr.ORG
Message-ID: <266259@gate.kc5aug.ampr.org>
Source record: 32344

In reference to the 1274 connecting and stopping in converse mode.

I ran across a problem with a closely matching description. When I
connected on my 1278, it stops right after saying ***CONNECTED TO ..."

I found that if I turned ACKPRIOR OFF, SLOTS 0, PERSIST 4,
that this cleared up my problem immediately. My problem was most
noticable when connecting to JNOS type systems.

Also, I heard from MFJ that removing C83 on the RX line to ground
will change the input response somewhat, and will sometimes cure this
same problem. On the 1274 it may have a different reference number.

346. Control via PC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-18 00:00:00 UTC
From: Todd Peterson <elab@netins.net>
Message-ID: <32E14CEF.5BBA@netins.net>
Source record: 32348

We are pleased to announce that our new application note,
'Device Control via the PC' is finally available.

This application note covers such topics as PC control of lamps and motors
using solid state and mechanical relays, device control using both
BJT and power MOSFET transistors, stepper motor control using a transistor
array IC, as well as PWM motor control using the L293 H-Bridge. Connection
to the PC is made via our inexpensive EDE300 PC Interface IC. Code examples
are also provided.

Feel free to download a copy today; it is available at
http://www.netins.net/showcase/elab in the 'Integrated Circuits' section
under 'EDE300'.

Todd Peterson
E-Lab Digital Engineering, Inc.

P.S. - While you're there, visit our Electronics Resource Directory,
a freely useable directory containing over 500 categorized hot-links of
value to the electronics community.

347. Re: DSP base TNC recomendation

This may be an idea whose time has arrived.
The 130 to 200 MHz pentiums with floating point arithmetic
and the new pentium with some DSP support should be the baseline
processors with the highest performance and availability combination.

Hi,

This subject is really very simple.

Most people wouldn't think of going into a store, taking software
off the shelf and leaving the store without paying for it. That
is stealing, right?

When you take something without permission, or without paying
for it your stealing - therefore you are a thief. Is this not
correct?

Why is it ok to steal from the software author, when you wouldn't
think of stealing from a merchant?

Some will say, I bought the software - I'll do what I want with it.

Sorry, this is NOT the case. You made an agreement before you began
using the product.

When you "buy software" there is most always a license statement,
or license agreement, by which you must agree to abide before
proceeding to "install" said software. This statement gives you
the right to "use" the software, not own the software.

(This is sort of like the difference between renting and buying
a home...)

You gave your word, and agreed to these terms before you began
using the software. You most always have the option to return
the product if you can't agree to the terms.

Here's a web site with some interesting facts on the subject.
(this site may be gone now?)
http://www.bsa.org/piracy/piracy.html

Please don't take food from the table of these hard working
individuals. Instead, help educate others. Software prices
will vary with supply and demand. More sales means lower prices
along with new versions.

Most software pirates haven't thought through what they are doing.

Thank you very much for your time and thanks also for your help.

73,
Jim - KU5S

349. WEFAX, FAX, SSTV, RTTY with Sound Blaster = OK

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-18 00:00:00 UTC
From: "Brian E. Cauchi" <gcauchi@keyworld.net>

Hello...

If you have a RADIO and a SOUND BLASTER (or compatible card) you already have all the hardware necessary to receive WEFAX, FAX, SSTV and RTTY.

You can also transmit monochrome FAX and SSTV, with the current version.

*** Put the power of your 80386, 80486 or Pentium processor to real use ***

The external "decoder" units that are used by conventional users are modelled inside the software. This makes it easy to get started, inexpensive and rids you of the inevitable tangle of wires and boxes of decoders.

Absolutely no external hardware, other than a simple audio lead, is required by FTV. The current version decodes:

WEFAX (from weather satellites, e.g. 137-138 MHz)
HF-FAX (from terrestrial stations)
SSTV (from radio amateurs, e.g. 14.230 MHz)
Baudot (press, naval, weather etc)

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) The incoming signal is analysed automatically - standard modes, line rates, baud rates and keying polarity are automatically determined following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

*** What are you waiting for? Try it now! ***

Take a look at my web site for futher details, from where you can download an evaluation copy, at: http://www.geocities.com/SiliconValley/2504

Be fore warned! A registered copy costs US$ 25, but after all, registered promotes the further development of this and other software while giving you the right to acquire all future versions paying only for delivery

expenses, if any.

Fianlly, just in case some of you have trouble accessing my web site, here is my postal address (if you want a reply, send a self-addressed label and IRC's to cover expenses):
Brian E. Cauchi,
Gawhra, Domenico Cachia Street, Birkirkara BKR06, MALTA.

What can I say? Try it, and may you have as much fun as I am having...
73's from Brian.

350. WANTED: 450 Mhz. crystal or synthesized ALPHA NUMERIC pager

Newsgroup: rec.radio.amateur.digital.misc

Source record: 32256
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.swap,rec.radio.amateur.misc,rec.radio.scanner

Hi everyone:

I am looking for a 450 Mhz. crystal or synthesized ALPHA NUMERIC pager capable of receiving (or recrystallable to receive) the frequency of 449.750 Mhz. Reason being one of our local clubs has a repeater on the 449.750- repeater pair capable to transmitting to pagers as if the pager was a radio receiving packets.

The pager **MUST** be 512 bps. POCSAC on the 70 cm meter band and a Motorola brand (There are several companies here in town where I can go to have the crystal installed). I'd prefer an Alpha Numeric pager over a numeric one because of the various message codes that are uninterpretable by a numeric pager.

I have an AT&T numeric pager capable of receiving a frequency of 158.700 Mhz. for trade.

If you wish to recrystalize the 70 cm. pager before shipping or if you have a pager that meets the aforentioned requirements, please drop me an email at pcook@dimensional.com to discuss logistics of such a trade. Each party pays for their own shipping and handling charges.

If you'd like to BUY the AT&T pager, email me at the above address to discuss price (I'm willing to offer $30 bottom price).

Many thanks in advance and 73's for now my friends!! :-)

Jim:

I hope that your attempt to educate turns even a few people around. Hams have to be the worst software thieves in existence. All you ever hear is stuff like "Oh, you like that program? Why don't you send me a copy?" and the deal is done. I deeply resent that because I pay out the rear end for their dishonesty when I walk into a software store and buy product.

The bottom line is that it appears that a large number of hams are dishonest, and they steal software simply because they can get away with it. It's sad and surprising because lots of these people seem otherwise fairly normal.

Good luck!

Hams aren't any different from the rest of the population, Dave. Most of us have been burned too many times by products that do not work as advertised. In the case of software, I am not aware of any commercial software that you can return for a refund after you try it. I don't buy software anymore without trying it first. If this means a bootleg copy, then so be it. I spent thousands of dollars on garbage software before wising up.

I do pay for software that does the job I need to do.

Tom:

While I abhor software theft, I do think that your point about bad product is valid. Some software is trash and retailers and publishers need to make trials available.

If you do use a bootleg copy to evaluate it and then either get rid of it or buy it, you are in effect establishing a policy that the publishers OUGHT to offer. I have mixed feelings about this kind of "theft". It seems that you can make an moral and rational argument for it. (not like the bozos that say that it's too expensive and that the publishers are "ripping off" the poor public and ought to be penalized, so they steal product)

However, if in fact you do adhere strictly to this procedure, you are in the minority. For every one of you there is probably 1,000 who never walk down to the store and plunk their money down.......but continue to use the program.

This is a huge problem. I know huge commercial institutions who own approximately one copy of MS Windows for hundreds of PCs. And all you have to do is listen on the ham bands to see that hams are really bad about it.

>coding reducing the throughput a bit.

Our VHF channels usually have a good SNR, and hence a low BER, so
you don't need heavy FEC. The main data loss mechanism on a contending
VHF LAN is collisions caused by hidden terminals. Without collision
detect, nearly the entire packet usually gets wiped out in a collision,
so even heavy FEC won't help. If we're going to use long packets, we
need to manage contention better than we typically do now.

>For text based applications the optimum packet size is 1-2 kbytes,

Page at a time is a little much for conversational keyboard to keyboard
contacts. Typically only a few lines of text are sent before the other
station replies.

>data rates. If there is only one server on a channel for a certain
>geographical area, the equalizers in the end user radios only have to
>train their equalizers for this single transmitter. The low speed
>preample could even be omitted.

Excellent point. An asymmetric connection could be very useful for some types of activity. The cluster typically only sends out one line of text, however, a Dx spot, so a cluster based LAN wouldn't benefit from an asymmetric channel. The BBS centered LAN would benefit because it does fit the model of low volume uplink and high volume downlink.

Both the cluster based and BBS based LANs would benefit more from a different change. In both cases, they repeat the same information over and over again to each station on the LAN. When a cluster receives a spot for example, it will retransmit it up to 25 times to all the stations connected to the cluster. This is very wasteful. And typically, a BBS will download the same bulletins again and again as each user logs on and reads them. That's also very wasteful.

I think both applications would be better if they were implemented as broadcast servers, ala pacsat. That would greatly reduce the amount of redundant information transmitted on the channel. An asymmetric channel structure would be easy to implement for the broadcast paradigm too. User uplinks could be on a second low speed back channel while the servers share a downlink channel which they have arranged to be non-contending, IE they could share it round robin, or some other deterministic way. Then your idea of a low speed preamble followed by trained high speed data would work well.

Gary

Check out our selection of goodies :Amateur Radio related Ham Tool Kit CD ROM, GSM Mobile Phones and accessories Electronics and so much more at our web site http://sphynx.com/murphy

To Check out our Stun Gun offer ..keep readingï¿½

What is a Stun Gun?

A Stun Gun is an electrical self-defense device that puts out a high voltage and low amperage shock. By merely touching a person with the stun gun, he is immobilized for several minutes with no permanent harm. Stun Guns are considered reasonable force to resist attack. They can be used many times to ward off attackers before the batteries need replacing.

Our Current Best Seller is the "Talon 250"ï¿½."The Finest Stun Gun in the World!"

Features:

Curved Head.
Strength: 250,000 Volts.
Power requirements: 2 X 9V Duracell Batteries (included).
Complete with hand-strap and belt clip.

Effects of the "Talon 250":

The Talon 250 Stun Gun does not merely rely on pain for results. The stun gun works on the muscular and neural system. A short blast of ï¿½ second duration will startle an attacker, cause minor muscle contractions and have a repelling effect. A sustained blast of 1 to 4 seconds can cause an attacker to fall to the ground and result in some mental confusion. It may make an assailant unwilling to continue an attack. A sustained blast of 5 seconds can overwhelm and control the attackers neuromuscular system IM-mobilizing him, causing disorientation and loss of balance. He will probably fall to the ground, feeling weak and dazed for some minutes afterward. Full recovery in this instance takes about 10-15 minutes. The "Talon 250" is effective through 1/2inch of clothing.

TALON 250 STUN GUN: ï¿½95 (Batteries included)

Methods of payment:

We accept payment by ACCESS, VISA or MasterCard.
NO Commission charged on credit card orders.

Recently I did the decent thing - sent the programmer his requested
registration fee of $20.00 for a shareware program I really liked. In
turn for registering the software, I was to get a 'code' emailed to me to
turn of the 'nag' greeting when the software ran. Several months have
gone by with no email. I sent the money because it was a good program
more than to get the nag turned off. However, developers do have to
offer some support as part of doing business. This is the Second Time
a shareware developer has failed to acknowledge a registration this way.
I'm beginning to think the registration (aside from the money) does not
mean anything. I am sorry developers get ripped off by people who
use their apps without paying for them - but trust works both ways.

I'm not convinced that it will make much of a difference.
I own a DSP4 and I have written some programs. I have previous knowledge
of C and assembler, but what I encountered while writing programs was
not only the 56001 assembler hurdle (that I could overcome in a few
weeks), but also the signal processing theory hurdle (that I could not yet
overcome).
So, I was able to write a POCSAG decoder/encoder by sticking together
some filters and a clock regenerator found in sources of other modems,
and writing the POCSAG bit-handling stuff myself. I would not have been
able to come up with the filters and demodulation techniques myself. This
would not have changed when I could have used C or C++, it is not a
coding problem, it is a design problem.
(I also wrote an EEPROM programming program for the DSP4, which is no
signal processing program, and I had no problems with it)

The situation will probably be the same for most programmers who want to
enter the amateur radio DSP field. For non-programmers who have to learn
what assembly programming is about, things may be easier in C. But then
they better be signal processing experts, because having to experiment
in these two disciplines at the same time is almost certainly leading to
failure...

>The hardware base suggested is sufficient to achieve markedly better
>performance than most available hardware solutions for *voice grade
>radio* use, and likely better than some dedicated platform DSP solutions.
>Speeding packet up beyond that requires special RF hardware, and in some
>cases, requires regulatory relief. That's a worthwhile direction to go,
>but it isn't the only direction where cutting edge improvements can be
>made.

Given the time that DSP cards are available to amateurs now, I am no
longer that optimistic about what they are going to do for packet radio
modems...

(of course I was enthousiastic when I first heard those lectures about
experiments with multitone PSK modems, but where are they now?)

>This shouldn't be looked upon as a method to achieve higher UHF+ packet
>speed. This is intended to improve average performance in the low to very
>low speed arenas, especially for weak and noisy signals, IE satellite, HF,
>etc.

I'm afraid it has turned out that way, yes. How often have we heard the
question "why can't we do some decent speed over an FM radio channel when
the telephone folks can do 14k4 (28k8, 33k6, the speed they compare with
has only increased over time while we were kept at the same 9k6 rate)"?
Of course I know some explanations for that, but not all of them are
completely unsolvable.

We (in the Netherlands, also in the rest of Europe?) at least seem to
have the regulatory advantage that we have no bandwith or baudrate limit
imposed on our transmissions (other than the band edges)...
Nice to have one advantage over the USA, where a super-ego (who once,
long ago, lead the BBS software field, you probably know him) is trying
to condemn any limitation to hamradio message content or source
identification found in other countries as censorship :-)

That is a heck of a story, and the one good thing about the
communication "age" is that we can be vocal about rip-off artists. I
really hate to hear this, because shareware is extremely abused, and
what you did was rare. I have thought about writing some shareware as a
hobby, but if these bad eggs are ruining it for honest publishers, I
might think twice.

I've got a problem, why do they require you to purchase beer, when we only rent it...How many times do you purchase an artist's (programmer) program package, take it home install it and find out it's a piece of shit. Try returning it, oh you opened the box...Well you're software overwrote the drivers installed in the windows directory for my other program..The artist used the same filename with a dll extension....Will the author come out to my house and fix the agony that will take 5 hours to reinstall, or worseoff, the other program has some obscure write protection in place which prevents re-installing by the already licensed user...Programmers have fucked me in this way more times that I can count. Get a life, stop your bitching and write about something ham related the next time you send a message to *.newsgroups...and have a nice day.....n2cjj@ibm.net

>it. (not like the bozos that say that it's too expensive and that the
>publishers are "ripping off" the poor public and ought to be penalized,
>so they steal product)

By this definition, I have "stolen" every piece of software that I
have bought in the past ten years.

Back in the 80's, I purchased a piece of software (don't remember
the exact name) that was advertised as being "100% dBase III compatible".
The product was about $400, which at the time was roughly half the price
of the dBase product on the market. Even the box that the software
came in (a very professional-looking product) said that the software
was "fully dBase compatible".

Well, lo-and-behold, a "readme.txt" file copied to the hard drive
during installation contained information on dBase commands that were
"not implemented". You could code them in your program, but they didn't
do anything at all. All of these commands revolved around multi-user
database access (RLOCK, FLOCK, and so on). Furthermore, the readme manual
stated that other "multiuser" features were not present (such as the
ability to SET EXCLUSIVE OFF to allow multiuser .DBF access).

Needless to say, I was quite mad, because these "non-implemented" features
means that the software is *NOT* "100% dBase III compatible". I called the
company to complain. They said "sorry, but it >is< dBase compatible, your
program will run just fine, you just can't have two people access the
same DBF file, and that isn't our problem. Oh, and since you opened the
disk pack, the software is non-returnable." A complaint with VISA yielded
nothing, since technically I received the software I ordered (even though
it didn't work as advertised.) I complaint with the CA AG's consumer fraud
division was pointless and got nowhere, nobody there understood the
issue in the slightest..

In the end, I ended up paying something like $1200 (had to go buy a copy
of dBase III after all). Since that day, I have >never< purchased a piece
of software without first obtaining a bootlegged copy of the software to
install and try out first. Is it "theft"? Technically, yes. Do I care?
Absolutely not. I'm not going to get burned again. Just as the other person
indicated, when I do try out a piece of software that I want, and find it

works as I expect, I do purchase it. If not, I get rid of it.

In most cases, I try to purchase products from companies that have a "try before you buy" policy. A 60-day free trial is a real treat to see if a product is really going to live up to its expectations. I am especially suspicious of companies that do not offer such trials, and go through great lengths to prevent you from copying their software, since in many of these instances I suspect they have something to hide.

In many instances, "legitimate" companies that I speak to in the course of my professional work as an author generally indicate (off the record) that they don't mind people "bootlegging" their software to try it out. As long as after you try it out you either purchase it, or stop using it. Their attitude is they would rather have you try out a bootlegged copy of their software to see how good it is rather than have you purchase a competitor's product. Its my opinion that any company or software author offering a professional product that they intend to stand by should not have an anal-retentive policy towards people trying out their product before it is purchased.

Ed Foster, in his Infoworld Gripe Line column, indicated recently that we might see some changes to the UCC (Uniform Commercial Code -- codified laws that govern business transactions) that will protect software purchasers in the future (requiring businesses that sell software to actually live up to their advertised promises).

>However, if in fact you do adhere strictly to this procedure, you are in
>the minority. For every one of you there is probably 1,000 who never
>walk down to the store and plunk their money down.......but continue to
>use the program.

Yes, this is true. However, despite what the SPA likes to paint, most of these people wouldn't purchase the software anyway, even if they had to. Thus, the "15 billion per month" (or whatever the ridiculous number is) that the SPA claims is lost to "piracy" is over-inflated.

Software piracy is a legitimate problem, and companies do need to be aware of it. However, piracy exists in every aspect of commercial goods that can be copied: CDs, tapes, video-tapes, and other commercial products are all copied by people and freely distributed amongst themselves.

>This is a huge problem. I know huge commercial institutions who own
>approximately one copy of MS Windows for hundreds of PCs. And all you
>have to do is listen on the ham bands to see that hams are really bad
>about it.

This is clearly behaviour that nobody can condone. However, I would say Hams are no worse then the general population. They are just stupid and talk about it over the radio.

Although the temptation is to let your semi-literate, immature tirade speak for itself, I believe that this is as much of an issue for hams as most of the other postings on this group, especially given the magnitude of the problem. Just listen to 2m and 75m. Just because a guy is trying to raise awareness of a legitimate issue shouldn't make him a target, especially when he is dead-on correct and only the most twisted logic could "refute" his statements.

There is lots of bad software out there, and most of the problem is indeed a result of the publisher's application developers taking shortcuts. They need to be called out for this. I share your frustration because I've had all that stuff happen to me several times.

But you appear to make an argument that it's okay to steal because you have been dissatisfied in the past. I don't see how that reasoning holds. Does this propensity to grab anything that's not nailed down and run hold in other areas of your life? Steal a CD because you bought an album earlier and didn't like it? Steal a car because you spend 20 grand for another one and the thing was in the service bay for weeks? The bottom line is that you steal what you can as long as you can easily get away with it. And you're telling KU5S to "get a life"? All KU5S is saying is that not everyone is like you and some would stop this practice if they gave it a little thought. He seems to have a bit of faith in his fellow amateurs, which is welcome and refreshing.

Nice idea... of course, it would be best if it was set up in such a
way that all variable equalization would be done at the receive end,
so that everyone can receive transmissions by a single station.

Difficult to predict how well it will work in practice...
(ok, maybe you could run a simulation when some parameters of different
types of transceivers are known)

A lot of local packet nets do just as you say, but there are merits in the "multiple network" situation you deplore, which shouldn't be overlooked.

In my area, for example we have NetRom, TexNet, ROSE, and IP nets. All of these generally carry all types of servers, and the networks tend to back each other up when one or the other experiences difficulties. (If TexNet has a node down, I can simply use another network to accomplish whatever task I have in mind, ect.)

And, of course, there is the reliability limitation we all run up against with long-haul VHF/UHF networks... The larger the network, the greater the likihood that part of it will be dead at any given time. The only practical way to lessen the impact of this lies in redundancy.
With one network in place, a single dead node puts you out in the cold...
With two parallel nets (redundancy) a single node going down on one net does not put a halt to all end-to-end traffic, since the "other" net can take up the load while repairs are arrainged.

For a serious monolithic network as you describe, parallel redundant backbone links are the only practical way to go, since such a network would tend to be quite large.

A great advantage to parallel redundant backbone links is that speed upgrades and repairs can be done at a more relaxed pace, and are more likely to be transparent to users. No interruption of service is required.

It's pricey, but it's the only way you can expect reliability if there are no secondary or redundant networks there to take up the slack.

You've identified the problem, Paul. And your solution is probably
the only one practical in a contention environment. But it just won't
do. The low speed overhead on every packet, coupled with TR turnaround
delays, simply overwhelm the throughput advantage you get from training.
If we want telco-like throughput on voice grade radio circuits, then

we're going to have to nail up non-contending duplex links to get it.
Now that's certainly possible, but it would be a coordination nightmare
on the popular VHF+ bands.

The XYL sez I hafta sell something before I can buy more gear. I have a PK-232 MBX on my shelf which I've never hooked up. It has all the manuals and software.

I'm not sure what the going market is. Does $200 sound fair?

Thanks

I was reluctant to buy a HamComm interface from N9ZLE, due to the
excessive advertising he's done on Usenet, but now I wouldn't have one
of his units in my house if he paid me.

But I do want a nice little compact HamComm interface. Who sells
boards, kits, or completed units? It seems a little excessive to buy
one from Germany.

Hello netlanders,
while looking around on the web i came to this very interesting place:

http://www.concentric.net/~n9zle/hc.html

where Bruce C. Raisley, N9ZLE, offers HamComm interfaces.
Near the end of this web page you can find the following line:

"Register (fix) program for HamComm 3.0 only Not a true registration!"

Here you can download a small program REGHC which

PATCHES THE SHAREWARE VERSION OF HAMCOMM 3.0 !!

If you are limiting the size of the data part to 256 bytes as in the
current AX.25 specification, then I will agree with you. However, if
we take the maximum duration currently allowed for a single packet (2
s for 1200 bit/s), we can fit 2-4 KBytes into the same time at 9.6 -
19.2 kbit/s. Such long packets require some form of error correction
coding reducing the throughput a bit.

For text based applications the optimum packet size is 1-2 kbytes,
since it will fill the screen in one packet and the user will then use
some time to read/manipulate the page before sending some response
back. This was the approach used in block mode terminals in mainframe

transaction prosessing system and is also used in web browsers.

The only place that the use of unmodified communication grade radios is desirable is at the end user and only there. The end users are usually connected to a BBS/cluster and this is a tpical example of a client-server environment. Usually the bit rate requirement are quite different for the uplink (end user to BBS/cluster) than for the downlink. The uplink might very well be served by ordinary AX.25 at 1200 bit/s. The receiver at the server does not even have to use an equalizer. However, the downlink would certainly benefit from 9k6+ data rates. If there is only one server on a channel for a certain geographical area, the equalizers in the end user radios only have to train their equalizers for this single transmitter. The low speed preample could even be omitted.

Yes, there are 56kb tnc's out there on the market. WA4DSY 56kb modem is sold by Paccom communications...and no there is not a dual port 1200/56kb tnc out on the market.

If you would have bought a used Mac it probably would have come with a
word processing program (I forget what Mac used before Claris) and you
would have only paid $200-$250 total for the unit, a power cord, and the
keyboard and mouse. I know Apple itself is on its last legs, but used Macs
still have a lot of life left in them. I've heard of people who still use
Mac Pluses, made around 1985-86!

Here's an idea: If you want to try out... say... Windows95, and you
know where you can get a bootleg copy. Go out and buy a legitimate
copy, but don't open it. Get the bootleg, install it, and if you
like it, perfect, if not, return the new unopened package for the
refund, and destroy the bootleg. Problem solved, everyone happy.

I have to agree with both here. I have been shafted by several of those
anal-retentive so called "software authors" I have paid up to 40
dollars for a program, only to find that it was a beta version, it didn't
work worth a crap and it was never upgraded. So I ended up having in a
couple of cases reconfiguring the computer as the software changed
several things in the config sys file and did not state that it was going
to and did I want to. I since have given up on the "shareware" clowns
and only buy top line software from a reputable source. Burned three
times is three times to many to be nice to them guys that wite crap any
more. My advise to the wannabe and at present software/shareware authors
is to either do it right or stay away from it, period..... All you do is
tick off a lot of guys that do a lot of talking (hey, hams talk with the
rest of the world as a hobby) about how they were ripped off by so-in-so.

Fred

I may not always agree with what you say. But I will defend to the
death your right to say it.

Recently have found plenty of "look alike" software in major book stores
and computer stores for a song as far as price is concerned. For
instance, about 2 weeks ago was in a Books and Co. (no I don't work for
them nor am I associated with them in any way other than a customer) and
found a set of four CD-ROMS for around 16 bucks. Word processor,
"excell" type spread sheet, graph maker and a "sticky note" program with
audio message capacity. Price......16 bucks......not to be passed up.
No need to buy the wallet busting stuff.... Just look around. All top
line software and not shareware!!!!!

Fred

I may not always agree with what you say. But I will defend to the
death your right to say it.

It's sad when Authors have to resort to this due to the blatant abuse of a few. HamComm is a good program and, unfortunately, many good Shareware programs are "hacked" by small-minded SOBs with a little programming experience.

>>the right to "use" the software, not own the software.

What license. Such alleged licenses have yet to win in court.
I assume you are talking about shrinkwrap and/or shareware.

In the shrinkwrap, the license is NOT agreed to by anyone just
because they purchased it. In shareware, there is no license
at all...only an expectation based on honesty that users will
pay for it if they CONTINUE to use it.

As to ownership...I own all the software I have. It is not leased
anymore than the books on my shelves are leased. There has
never been any case involving over the counter software that
has established that the purchaser only has a use and not actual
ownership of the copy they bought.

>>(This is sort of like the difference between renting and buying
>>a home...)

>>You gave your word, and agreed to these terms before you began
>>using the software. You most always have the option to return

>>the product if you can't agree to the terms.

Not true for most software, especially shrinkwrap. Once its
opened you can't return it. In any case, I stand by my comments above
also as to ownership and licenses.

>>Here's a web site with some interesting facts on the subject.
>>(this site may be gone now?)

Nothing wrong with being honest, but it works both ways too.

>>Most software pirates haven't thought through what they are doing.

This also depends on what is or isn't piracy of software.
Go to any computer show and you can buy used software at
very cheap prices. Piracy? I think not.

Now back to the regularly scheduled ham related
newsgroup subjects.

>receives a spot for example, it will retransmit it up to 25 times
>to all the stations connected to the cluster. This is very wasteful.

A few years ago Vesa OH3NWQ wrote a PC based program to extract the
DX-spots by monitoring messages sent to some other connected users.
It did not gain popularity among DXrs since you had to connect to the
cluster to send talks and send your own DX spots. A much serious
problem was that at that time, the typical VHF/UHF setup at a DXrs
station consisted of an old crystal controlled radio, a TNC and a dumb
terminal or alternatively of a modem chip and the C64 (and I allmost
forgot, these stations often included an FM-booster if there were any
problems staying constantly connected to the cluster). A smart program
did not much of a chance to win popularity in this environment.

>And typically, a BBS will download the same bulletins again and
>again as each user logs on and reads them. That's also very wasteful.

A pacsat style system would be nice if all users would have radios and
computers that would be on 24 hours a day. Until Linus and Windows NT
becomes more popular, I don't think the pacsat principle would be
popular before that.

An other problem with the BBS forwarding traffic is that no one is
reading 90-99 % of it. It is distributed to all BBSs but also to all
end users requiring a lot of air time and disk space. A better
approach would be to store the actual files in a few places and
distribute only the headers. The users could then retrieve the
messages bodies required. With some caching at the local BBS, the main
part of duplicate traffic would be eliminated. This would require a
(preferably duplex) backbone network with short latency time.
For this type of operation the asymmetric end user connection would be
preferable.

Jim -
I think that perhaps you have missed the point of Django's initial criticism of N9ZLE's actions as well as the subsequent comments made by others. The crux of the matter has nothing to do with what N9ZLE is selling or his service, but rather what he is distributing for free. He is giving away a patch that effectively removes one of the incentives for users of HC 3.1 to send in their registration payment. Besides having the appearance of an exceiptionally malicious act, if this sort of thing were widespread, it would mean the end of shareware as we know it. Django has invested 100's (and more likely 1000's) of hours in the development of a really first class piece of software. Now someone has taken this unfortunate step which tends to deprive him of a decent return on his effort.

You really headed off on a tangent when you brought up the subject of "shelfware". Consider this, Jim - the evaluation copy of HC 3.1 is full featured in every respect save three: PACTOR receive, the ability to run under WIN95, and the registration message. The balance of the CW, RTTY, and AMTOR functionality works the same on the evaluation copy as the registered copy. If ever a developer has bent over backwards to provide potential users with the opportunity to evaluate shareware before purchase, this is it. In return, it would appear that N9ZLE has taken advantage of Django's generosity by publishing this destructive patch.

When all is said and done, I suspect that N9ZLE's motivation was not so much to be malicious, but rather to demonstrate what a clever guy he is (assuming that he did in fact develop the patch himself). I would like to think that if enough people wrote rational letters (e-mail and otherwise) to him which tactfully point out the error of his ways, he would see that this action is in nobody's best interests and the patch will be
removed.

390. KPC-3 -> Yaesu FT-50R

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-20 00:00:00 UTC
From: "Todd E. Schroder" <schroder@erols.com>
Message-ID: <32E3006C.33D9@erols.com>
Source record: 32286

I assembled a connection cable for a Kantronics KPC-3 to a Yaesu FT-50R HT. I can 'monitor' packet activity, but when I attempt to 'connect', the TNC keys the transmitter but the 'connect' fails and it sometimes doesn't release the transmitter. Also, I don't hear the typical packet 'burst' using another radio tuned to the same frequency.

I am a bit confused by the wiring diagrams. The manual shows a PTT isolation circuit of a capacitor and a resistor in the PTT line, but the text refers to an internal jumper for use with HTs. Does the relocation of this jumper eliminate the need for the circuit in the cable or are both required?

For my installation I relocated the internal jumper to the 'HT' position and did not install the isolation components.

Thanks,
Todd KF4KHM

I can't believe you clowns. Here you are, defending theft. But let someone
just *think* about operating a ham radio without a license and you would be
sreaming bloody murder. By the way - you may think that the ham license with
your call on it is yours - it's not. It belongs to the government, which can
revoke its use at any time. You're a bunch of hypocrites.

Read the packages, folks. You don't own the software. If you want to whine about it, then whine about it on the airwaves and keep the crap out of the newsgroup.

Bill, I hope you don't instill your crap to your students. If you don't even bother to read the shrinkwrapped notices, I really question whether you are qualified to teach anyone anything.

Of course it's piracy. What have you got? A dictionary with some of the definitions you don't like substitued with those you dream up???

Idiots.

>- CrACKeD

You've been mis-informed. POCSAG is transmitted much as 9600 baud
packet - direct FSK. As such the KPC-3 modem is not capable of
encoding/decoding POCSAG, however the KPC-9612 is and there is a
firmware upgrade to allow it.

397. HamComm interface help needed . . .

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-20 00:00:00 UTC
From: Morgan Lee <morganza@communique.net>
Message-ID: <01bc06e6$2d131000$ec7b1bcc@morganza.communique.net>
Source record: 32293

I am trying to hook up a HamComm interface to my radio, a Yaesu FT890,
and am uncertain as to how to go about this. I've been using DL5YEC's
HamComm
program (an exellent program which I cheerfully paid for) and a homemade
interface which plugs into the phone jack on the front to receive digital
signals.
I then ordered the HamComm interface from N9ZLE.
I emailed N9ZLE for help with his interface but haven't heard from
him yet so, being impatient, I'm seeking help from other sources.

The best that I can figure is that I should run the
PTT wire from the interface to the PTT plug on the back panel
and the Receive audio(Yellow wire) to the "data out" portion of the"data
in/out" jack on the back
and the Mic audio (green wire) to the "data in" portion.
The gound wire (black) would go to the chassis ground on the radio?

Am about to "mess up" or am I on the right track?

Since I obviously don't have any idea what I'm doing I could sure use some
help with this. I'd especially like to here from anyone who has used this
interface with
an FT890 since the manual has some other comments regarding digital modes
that
I don't understand.

Thanks,

Morgan
KC5IIY

Just wanted to get my opinion in here somewhere. My dad recently purchased a used computer for my little sister who is in high school. The computer didn't have any word processing programs on it and this is what it was purchased for. I went in search of the elusive "word for windows." Nobody carried it. I found plenty of upgrades. I expected to pay between $80 and 160 for this product. I finally found it. $320!!! HOLY SHIT! The computer only cost $500!!! I finally gave in for a copy of MS works for $59. The word processor on there works for her needs, but the way the page is displayed on the screen is kind of a pain in the ass. It is only half the page from side to side so as you type to the side of the page, the page shifts back and forth. Stupid. What are my alternatives? 1. Finding someone with a copy of Word for windows would be nice. I don't have a copy. I bought the computer used and the program was on it already. 2. Fork out over 300 bucks for the latest, greatest, wipes your ass when you're done new program.

Q: Why can't I purchace an older version of the software that maybe wouldn't cost an arm and a leg? I really don't think my little sister needs all of bells and whistles on the super duper version. I WOULD BE WILLING TO PAY FOR THIS. (I know...how white of me) I am NOT willing to pay for all of the bells and whistles that the latest program comes with. I don't need them and I don't want them.

Sorry to ruin your party. I just had to get that gripe in there.

OK. What's wrong with asking the 'ligitimate' owner a chance to test
drive the program at his or her site to see if you like it? This
would be the ONLY legal way to do it, and it keeps you from
cluttering your disk with useless junk.

I don't buy into the 'I've been burned before' bull, although it
would be a rather cute justification for these illegal actions.

Whoa. You're painting with too broad a brush, here. I'm a ham operator, extra-class - the highest license. AA7AS. I've also passed the commercial licenses. I do not, repeat NOT, support piracy, or the nonsense that this guy was spouting, and I know other hams that do not. Piracy is rampant among hams, but I am not sure that it is any less so than the general population.

> I really question whether you are qualified to teach anyone anything.

I completely agree - but unfortunately, ethics is not part of the teaching syllabus in most edu systems - for that matter, if it's not taught in schools, many people have not even the basic ability to reason through the issues. It is my considered opinion that this situation is directly the fault of the educational system, and the fault of parents, who extend the problem of their own ignorance in these critical social areas. Obligation? Responsibility? Not Me, cry the public, and there you have the root of the problem. Add to that, little, if any, ability to understand the difference between a moral and an ethical issue and you have a pretty chaotic consumer-base.

> Of course it's piracy. What have you got? A dictionary with some of the
> definitions you don't like substitued with those you dream up???

What he probably has is more powerful than a dictionary. He's likely got a good case of self-delusion going - and I honestly don't believe you can fix the problem in an adult.

>
> ab7fb

The TCM-3105 is a FSK modem chip, made (usually) by Texas Instruments.
They consider
the chip obsolete, since DSP is the new big 'thing'. I have built a
'Baycom' type
modem from a kit that I bought from JDR Microdevices. It works quite
well. They also
sell the chip alone for about $10. Call them for a catalog
1-800-538-5000 or
hit their web page at http://www.jdr.com

BTW, quite a few of the 'big' TNC's use the 3105 chip (like Kantronics),
so it works
pretty good.

The idea behind the ASP - Association of Shareware Professionals - is to
try to
put some guidelines for the shareware developer in place. If you look
for
the ASP logo in a shareware package (most brag about it), you will
usually
get a better product, since it's usually been reviewed by a panel first.
And you will usually have a lesser chance of not receiving
acknowledgement.

I apoligize in advance if this doesn't belong here... what can I say?

I'm looking for information on duplex data satellite systems =-= cost and reliability figures. I need to install a system in a VERY rural location. The data rate need not be huge - 2Megabit/second should be sufficient to start with.

Can any readers here point me at the right newsgroup, or even the right systems? Any and all help would be greatly appreciated.

Please e-mail to lurch@eskimo.com

From: master3723@aol.com
Message-ID: <19970120160801.LAA25361@ladder01.news.aol.com>
Source record: 32304

I am having trouble getting the same setup to receive.

I have an FT-50R, KPC-3 box and a Toshiba Satellite Pro 400CS.

The KPC-3 software supports only COM1 and 2 (the computer has 4 ports, one is used by the modem) and it dose't matter how I hook it up, I get nothing from the KPC-3 when I turn it on.

Also, I have tryed using Hyperterminal in win95, still nothing.

There is a cable diagram in the Yaesu ft50-r manual for packet radio that may work better than the one in the Kantronics manual (since nothing in the Kantronics manual has worked so-far), unless that is the cable you already built.

Looks like you are using Erol's, if you are familiar with North VA are the Fairfax Co. VA police data freq's encripted?

thanks in advance

Master

Are you using the rubber duck antenna? Is the connection cable shielded? I couldn't get my FT-50R to work correctly unless I used an external antenna, because the RF from the transmitter prevented the transmitter from unkeying. After I used an external antenna, it worked fine.

I think I followed the wiring diagram in the FT-50R manual, rather than the diagram in the KPC-3 manual. I'm also using the 1 to 2 pin microphone adapter on the FT-50R.

>I can't believe you clowns. Here you are, defending theft.

Some of us don't believe software piracy is theft in the traditional sense. In order for something to be stolen, one party must suffer a loss. It's unclear whether or not this happens in many cases of software piracy. I'm not saying that piracy is morally acceptable - that is for each person to decide for themselves. But it's not traditional theft. That's why there's a different name for it, piracy. Some people feel that some forms of piracy actually help the industry, by advertising the products and allowing "try before you buy." It's not a clear-cut issue.

>sreaming bloody murder. By the way - you may think that the ham license with
>your call on it is yours - it's not. It belongs to the government, which can
>revoke its use at any time. You're a bunch of hypocrites.

Where have I defended theft? Please, be specific.
As to my license, and call, just who claimed it couldn't be revoked?
What's your point to even mentioning it.

>Read the packages, folks. You don't own the software. If you want to whine
>about it, then whine about it on the airwaves and keep the crap out of the
>newsgroup.

Learn something about the law. You can't enforce a contract (i.e.
license) after the purchase. As above, just provide us with one
case law cite to substantiate your claim.

>Bill, I hope you don't instill your crap to your students. If you don't even
>bother to read the shrinkwrapped notices, I really question whether you are
>qualified to teach anyone anything.

Again...shrinkwrap licenses are not enforceable. If they were, you'd
have seen it done already.

>Of course it's piracy. What have you got? A dictionary with some of the
>definitions you don't like substitued with those you dream up???

Nothing I have written here condones actual piracy. It is in your
mind that you seem to think that.

Hi Bill - Think of it as buying a book. You own the book, but you're not free to reproduce the contents in any manner without permission from the author ("fair use" aside).

Another example would be purchasing a video taped movie; you own the tape but just try making copies and then distributing them!

This topic really has nothing to do with ham radio. ("But my computer runs my radio!" some will say, and I'll respond that my home houses my radio but I don't discuss carpentry on here.)

Greetings, Folks:

I am currently studying for my Tech license (I'm even going to try the code) and I'd like to know where I can get some current info about packet radio. The different speeds, protocols and manufacturers are dizzying to me. Is there some information source that I can go to to learn about it all? The only books I have been able to get at the library are 5 or more years old. I tried to contact the local ham club, but they haven't replied to my letter.
If anybody could steer me in the right direction at least I'd be very grateful.

Thanks,
Matt

Hi Matt -- there is an excellent packet tutorial by Larry Kenny and
several links to packet radio on the DX Reference page below. Go to the
index and click on "Packet Tutorial" and "Digital HF" -- lotsa info in
each.

Hi
The TV Channel 3/4 switch on VCRs selects the channel output of an
RF modulator. The VCR provides audio and NTSC video to that RF modulator.

We are looking for about 1,000 RF modulators for a production run.
Anyone know a source?

The ELNEC and EZNEC antenna modeling programs can be returned at any time
for a full refund if you're not satisfied. This has always been my policy
(I am the developer and seller), and is stated clearly at the beginning of
the manual. The return rate has been roughly one in 300.

I've gotten a refund with no hassle for two other programs I've returned.
(One was in the $50 category, the other around $1000.) Perhaps you should
choose your vendors more carefully.

You take and use anothers' property without compensating
them, while knowing that compensation is expected.

Not to put too fine a point on this, but whether you call it
"piracy" or "theft" or "sproing", the issue seems clear cut
to me....

..... it is stealing, no less than asking me to provide
some other useful product or service to you and then not
paying me for that effort.

Unfortunately, most software licenses aren't setup this way.
Borland has a "like a book" license (which I consider perfectly
reasonable), but most of the other software vendors don't. They
claim to retain ownership of the product you thought you bought.
All they say you're buying is a license to use it, IE they are
claiming it is defacto a rental.

Now I don't have a problem with that either, if the software vendors
would treat it like a rental, IE I expect them to deliver a functional
product meeting their claims, I expect them to maintain their product
for the duration of the rental, and I expect them to allow me to cancel
the rental agreement and get a refund of the unused portion of the contract
if I'm either not satisfied or find I no longer need their product. But they
don't do that. They claim that once the shrinkwrap is broken, it is
my problem. They disclaim all liability. And that's defacto a no
warranty sale.

That's why shrinkwrap licenses haven't held up in court. If it waddles
like a duck and quacks like a duck, its a duck no matter what else you
want to call it. The courts have found it to be a no warranty sale, not
a rental, so the product does belong to you, and you can do with it what
you like (within copyright fair use guidelines, IE like a book). If I
own a book, I can rip out pages, scribble in the margins, sell it to
someone else as a used book, etc. If I don't like the way the book
ends, I can rip out the last chapter and glue in one of my own. It
is mine, I can use or abuse my copy of the book any way I like. I

can even burn it if I want.

I can't xerox it and sell copies, and I can't pass it off as my work. That's piracy and plagarism respectively. But I can reverse engineer it or patch it to my heart's content. Almost all of the shrinkwrap licenses say I can't, but the courts say those restrictions aren't enforceable. Note all this applies only to the single copy I bought. I can resell that *one* copy, no matter how I've modified it, but I can't make other copies and sell them, or even give them away. That would violate copyright, and would be piracy.

True licensing also exists. IBM practiced it with mainframe software, and a few other companies did too. One had to negotiate and sign an agreement, a contract, *prior* to tendering payment, to be allowed to use the software. This is a true licensing arrangement freely negotiated by both parties prior to the transaction, and the vendor retains ownership of the code, and responsibility for its behavior as well, during the period of the license. Where shrinkwrap licenses fail is that the terms are not fully disclosed until after the point of sale, and the vendor won't give a full refund after the shrinkwrap is opened, so the terms are not freely entered into by the buyer.

Now shareware falls in a special niche. It can be divided into two rough categories, crippleware and begware. Crippleware has some key functionality disabled, and the author expects someone possessing a copy of the program to pay the author for an authorizing code to restore that functionality. There is no legal liability to do so, however. People can do without the functionality, or they can patch or reverse engineer the code to restore the functionality themselves. Now I don't like crippleware, but it is the author's right and choice to distribute it that way. If I want the full functionality from the program, I'll pay.

Begware is fully functional, and depends solely on the charity of those possessing copies to send money to the author. There is no contractual obligation for anyone to pay for begware. It is strictly a matter of conscience on the part of a possessor of the shareware. The fact that a good number of people do pay for begware is rather remarkable. I like begware, and I send the requested donation to the author of begware that I like and use.

In both cases the code is freely given to people prior to any transfer of funds or any formal contract being drawn. Like the case of the shrinkwrap license, the only protection the code retains is copyright. And like a book, the possessor of the code can do with it as he likes under fair use, including patching or reverse engineering it. But unlike the case of the book, the shareware author has also given explicit permission for people to copy and redistribute his code at will. This is how shareware is distributed. So it is like a book which says "Xerox me" on the cover. It is impossible to pirate shareware because what could be called piracy in another context is in this case specifically authorized

by the shareware author.

(Redistributing an authorizing code issued by the author of crippleware would be piracy, though, because it was not freely distributed. You only bought one copy, and that's all you've got, one copy. You can resell that one copy, but you can't *make* copies of it for redistribution. It is *not* shareware.)

The thing that started this thread, the offer of a patch to remove the begware notice from a piece of begware, is not piracy. It might not be nice from the POV of the begware author, but it isn't piracy. It is perfectly legal for me to tear the author's bio out of a book I possess, or discard a publisher's ad tucked in the book. If someone wants to give me a tool to make that easier, he can do that too. I think this is harmful to the concept of shareware, but it isn't illegal.

I use an MFJ-1278 on my TS-930 through the mic plug and taking the receive audio off the back on my extenal speaker (a y-plug). I wired my own cables until a bought the pre-wired ones from MFJ. Works great! Also I've used the same cables with my TS-2550 on 2M.

Piracy and Customer Satifaction:

Although software piracy is a problem, it does not EXCUSE any vendor for providing customer satisfaction. I have learned not to purchase anything without an option of a full refund if I'm not satisfied with a product.

I am sure that everyone else agrees that there is a lot of junk software out there and I for one will not take a gamble on any package because of the piracy problem. If your vendor cannot accept that, then perhaps some time needs to be spent on your part for finding a better vendor.

Hi All,

I have heard that it is possible to use the 2.5Mb arc net cards for high speed comms over radio with some mods...

Apprently there was an article in an american mag, some time ago adivsing how this could be done..

Does anyone know anything about this, or where I could get some more info ?

Replies either via email or this thread please..

427. Software compatible with Optolinx dataslicer

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-21 00:00:00 UTC
From: Scott and Donna Halligan <halligan@capecod.net>
Message-ID: <32E55154.6289@capecod.net>
Source record: 32229
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.shortwave,alt.radio.scanner.uk,rec.radio.amateur.digital.misc

Hello all,

Just FYI, I have tested the following software with the dataslicing capabilities of the Optoelectronics Optolinx. All tests have met with success.

1. AEA ACARS 900 - reception of 2400 baud digital aviation mode.
2. Software Systems Consulting PC-SWL - many digital HF modes including Baudot RTTY, Sitor A and B, and NAVTEX.
3. HamComm 3.1 - ditto #2.
4. PKTMON 1.2 - HF and VHF packet radio.
5. POCSAG DECODER 2.03 - 512, 1200, and 2400 baud pager mode.

To make this work, run a cable from your speaker or record out jack to the AUX input on the front of the Optolinx. Run your software and enjoy! Neat stuff, considering I had no idea that the Optolinx had this capability when I bought it to computer control my AR-8000!

Enjoy...

Scott

>
>73 TODD N9OGL

The Kantronics Data Engine will handle the 56 kb modem, and it is dual port. The PacComm Spirit TNC claims to handle 56 kb, but I haven't confirmed that. It isn't dual port. But you're much better off to use the Ottawa PI2 card in a PC instead. It works with no hassles, and it is dual port. If you can't use the PI2 card because you have a Mac, don't dispair. The MAC serial port has an 8530 built in, and there's a driver available, so you don't need any other hardware for it. If you're using a Sun or Silicon Graphics box, I don't know what to tell you. You may need a TNC in that case.

If you're setting up a switch, I'd still suggest a PC and the PI2 card rather than a TNC. You can put together a cheap clone PC for less than a new Data Engine, and our experience is that they live fine on unconditioned mountaintops. And parts are available on every street corner if it does die. Use JNOS as your switch code. A 386SX with 1 Mb RAM will handle the job fine. You don't need to leave a monitor or keyboard at the site, just bring them with you when you want to do maintenance.

Probably the best source of information is on the web, forget books.
Use infoseek, or altavista, etc and search for keywords like "TNC",
"PACKET RADIO", "N6GN", "HIGH SPEED PACKET", etc. I have seen some pretty
good web pages out there. A good starting point would be
http://www.tapr.org/tapr/html/pkthome.html . (Please join TAPR too !).

Also on the TAPR www site is the "North American Digital Systems
Directory". This will show you the active packet stations in your area.
This information used to be in the ARRL Repeater Directory, but they are
dropping that and letting TAPR take it over. I am thinking that a
starting point might be that if you see alot of 1200 baud 2 meter
stations listed in your area, go out and get a 2 meter transceiver (any
2 MTR FM mobile rig will do), and a TNC and jump into it. 1200 baud 2
meter packet is pretty much plug and play. The downside of it is that
it looks like 9600 baud, mainly on 440 Mhz is obsoleting 1200 baud, at
least in my area. I have a feeling that alot of people here would
probably recommend getting a 9600 baud station and not even dealing with 1200.
I just feel that 1200 is so easy to do, it would be a good way to start out.

Note that it is becoming possible to do this without even buying a TNC. Linux
can do packet radio with a sound blaster card, and KA9Q is writing
packet radio modems for sound cards too, if you don't run Linux.

Good Luck on your exam ! Keep us posted on how you are coming along.

>>
>>
>> The KAM is a good unit and really the only US made HF TNC worth
>> buying at this time (unless you consider the Paccomm PTC-II, with German
>> made parts).

Maybe that is true since AEA is out of business, but I felt the PK232 was
better at pulling AMTOR signals out of the muck than the KAM is. My PK232
blew up, and I replaced it with a KAM plus. I wasn't too amused that the
PK232 failed, it was about four years old. I figured that it wasn't high
enough quality. BUT, if AEA was still in business and I had to do it over
again, I would have bought another PK232 instead of the KAM Plus.

On about five occasions I was totally amazed that I could no longer hear the
station I was working on 20mtr AMTOR in the speaker, yet the PK232 was
still merrily updating my screen with what the other guy was typing. The
KAM Plus could never do that. Alot of times I can hear the signals quite
nicely in my headphones, and the KAM starts to choke. Pretty mystifying.

I do believe that the firmware in the KAM Plus has alot nicer features, like
the KANODE, and the Mailbox is better than the PK232 (my opinion of course).
I wish that the KAM Plus had SIAM like the PK232 though, that is a mode where
the PK232 takes a guess at what kind of digital transmission it is hearing.

Hello everyone! I just say a post asking for the Orlando packet frequiencies and it reminded me that I'm heading out to Seatle Washington for a week and would like to be able to be on packet. I run a Packet <--> Internet Gateway here in Winona Minnesota and I thought that if some people were interested we could send a temporary link-up between the a gateway in seatle and our wormhole.

The equipment that I'll have is:

Kenwood TH-22AT Handheld Radio
Kantronics KPC-3 TNC
Texas Insturments Extensa 510 laptop
a power suppy for TNC and Radio
and some type of antena (possibly a loop)

So if anyone in seatle would be interested in e-mailing me some frequincies and callsign (particularly the wormholes) or talk about try a link-up between Winona Minnesota and Seatle.

Actually, there are several software companies that offer a money-back guarantee on their software if you don't like it. Microsoft, for one. Maybe not for every program they sell, but "Flight Simulator", for example, comes with a 30-day money back guarantee. I think some of the stuff that Symantec sells also comes with a money-back guarantee. It's printed *right on the box* if you look for it. Also, a *few, very few* retailers still give refunds on software if you request it. I think there's a chain called "Micro Center" or something close to that which offers refunds on software. However, most stores do not.

Just my observations. (No refund.)

I beg to differ. What about some poverty-stricken student who gets
hold of a bootleg copy of, say, Photoshop? The price tag is way beyond
his means and he wouldn't dream of going out and buying a copy even if
the bootleg wasn't available.

There are probably thousands of people out there using software,
albeit illegally, in this way. You can't lose what you never had.

If you want to be able to read a full line of text you must either shorten
the lines (change the margins) or switch to a higher resolution on the
screen. If you switch to the higher resolution and cannot read the smaller
text, just get a larger monitor. Of course that could cost quite a bit.

Most 14" monitors these days can display 80 character lines or more in
800X600 resolution.

QST-

I am a new resident in the Nashville, Tennessee area and I am looking for any packet nodes. I was wondering if anyone would know of a good online resource to find any nodes here in the middle Tennessee area. I do not have time to listen during the day and at night I have not heard any activity in the standard packet regions of the 2m band. Please email me directly with any information that anyone might have.

73s,
Trent Smith

Question: What is a simple, inexpensive, and convenient way to start
this year off in a FUN, intriguing, and romantic fashion?
(Santa must have been holding out on this one!)

Answer: Dateline!

Now that Christmas is over and you have given everyone else presents,
it's time to treat yourself to something nice.....that someone
special. Someone to share in your hobbies, your interests, your
lifestyle, your LIFE.

Dateline is the perfect way to find someone and be found! Dateline
gives you the forum to seek out others whom you find interesting, and
let others know about you! And the best part is - you are in control
of what happens. Call often to leave and receive lots of messages
(remember - this service is HUGE and there are so many people from
all the area codes across the country calling in to find people just
like you!), or call in as little as you like and leave and receive
a few selective messages. You can also call just once to see what the
heck it is all about. Whether you are a little shy or outgoing
in the biggest of ways - it is a simple and inexpensive way to find
other singles. It is amazing how much fun people have with Dateline!

It is so convenient! You can call in from anywhere at anytime to give
and get your messages. This is a 24 hour service and you just punch
in whichever area code you are interested in - whether it is in the
place you live or the places you go! And it is really super if you
relocate and want to meet up with guys and gals who share your
interests and would love to show you around! (No wonder Santa is
always so jolly - his sleigh phone has the Dateline speed dialed in!)

1-900-484-7009 ext. 5241

$2.99/min. Must be 18 years or older.

Serv-U (619) 645-8434

Make this your Happy New Year's Resolution: To call Dateline today
and start giving and receiving those personal messages! Join in the
fun - and don't keep those folks who want to meet you waiting until
next Christmas.....

>everyone more because the software vendors must take into account all of
>the thieves.

This is where things become non-traditional. If someone steals your
car for a joy-ride, you suffer a loss, but if they make a *copy* of
your car and drive off in that, you don't suffer a loss. Now the
auto manufacturer might try to claim a loss, since he didn't get to
sell another vehicle, but as noted above, the poor student couldn't
have bought the new vehicle anyway. The only real loss may be to
Nike because the student won't have to walk everywhere and won't need
a new pair of shoes quite so quickly.

Now that doesn't mean it isn't stealing, it is, but what it means
is the claims by the software houses that they are losing large
amounts of revenue are based on the bogus idea that they've lost
a sale. They haven't, because there was never a possibility for
a sale in the first place. The student had a choice of ripping off
Photoshop or buying a #2 lead pencil and a sketch pad.

The common claim is that if it weren't for piracy, software vendors
would lower their prices dramatically. If you believe that, I have
a bridge I'd like to show you. Mercedes could sell a lot more cars
if they lowered the price (and there's enough margin that they could

do that), but you don't see them doing that. They are skimming off the cream of the market and ignoring the dregs. Most of the big ticket software being ripped off is doing the same thing. Piracy, as long as it doesn't cut into their lucrative cream skimming, is irrelevant to them (that's why software vendors get real upset at corporate piracy, because that threatens their cream market, but don't much care if some hacker rips off a copy of their software to play with at home). It is claimed by some that certain software vendors actually want some piracy because it helps them consolidate their dominance in their market niche by leaving no niche for lower priced competitors.

Now this latter is a real downside to piracy. Piracy tends to harm, not the company whose software is being ripped off, but the second tier company who might consider offering a lower cost product to sop up the bottom of the market, IE Ford Escorts can be sold because lots of people can't afford a Mercedes. If people could just copy the Mercedes, Escort sales would disappear. What you would *not* see is a lowering of the price of the Mercedes. That's a high margin cream skimmer, and Mercedes wants to keep it that way.

The reason piracy is bad is because it hurts the little guy who wants to do the right thing and buy his software. He can't afford the Mercedes products, and there aren't any Escorts for him to buy because piracy sopped up that market niche. So he doesn't have a place to spend his limited money. He winds up either having to do without, or turn pirate himself.

Now Borland had the right idea about how to deal with piracy. Since most pirates don't Xerox the instruction manuals, they have to go buy a third party book to learn how to use the software they just ripped off. What Borland did was price their product "like a book", so that there was no advantage to ripping them off, it cost the same either way, so people just bought the software with the manual. Some other vendors saw that as a threat to their cream market. They didn't want to lower their prices to match Borland, so they started including the manual online with their software so the pirates wouldn't need to go buy a third party book. This killed Borland's "like a book" sales tactic while not damaging the big software vendors' cream corporate market.

There are two ways to make a profit from sales of any item. You can sell a few at a very high margin, or you can sell a lot at a very low margin. It is cheaper to produce and market the high margin product than the low margin product because there are fewer customers to target, less product to produce and ship, etc. So the cream market is the most desirable one. But you can't do that if you have effective low margin competitors who are willing to undercut you in the cream niche. So you let the pirates consume the volume the low margin producer needs in order to profit, and you rid yourself of competition in your core market. You didn't want to sell to Joe Shmoe

anyway, because you'd have to cut your price to do so, and that would make your cream customers unhappy about paying a higher price for the same thing, so the fact he got his copy of your software via the Jolly Roger doesn't bother you.

There are effective ways to prevent software from being pirated. The dongle is the classic, but Intel also offered at one time to embed serial numbers in their chips so that software could be written which would only work on the particular CPU for which it was purchased. The software vendors didn't go for that. It would have removed piracy as an anti-competitive tactic in their cream skimming operations.

True! It often takes hundreds of hours to write, test and debug a program. Considering the limited sales potential of amateur related software, especially terminal programs and such, and the price most shareware authors are asking for registration, they are probably getting paid 25 to 50 cents and hour for their time - and some want to steal even that from them. If they charged "fair market value" for their time you'd probably pay upwards of $1000 a copy for a terminal program!

Most shareware authors will never get rich writting amateur radio related software. Registration at least permits the author to recoupe something for his time and effort and makes him feel the user's support and appreciate his efforts.

Although I tend to agree with Gary's sentiments, a couple of clarifications are needed:

A case recently *did* uphold the validity of shrinkwrap licenses. (_ProCD_v._Zeidenberg_, 7th Circuit, 1996 -- don't have the full cite handy).

This decision also held, in a brief and unnecessary discussion that is almost certainly dicta rather than precedent, that limitations on reverse

engineering in a shrinkwrap license are enforceable.

Trying to be objective (not always easy for me...), the ProCD case is probably correct on the overall enforceability of a shrinkwrap license, but goes too far in allowing restrictions on reverse engineering to be enforceable.

Unfortunately, the 7th circuit is well-respected, as is the judge who wrote the decision, so ProCD is likely to be causing trouble for a while.

You also need to be careful when talking about rentals in the context of software. There's a statute called the Software Rental Act that basically outlaws rental of software (except for some very limited exceptions for libraries, etc.) and raises some questions about to what extent the "first sale doctrine" (that allows you to resell a book) applies to computer software.

Exactly the point I was trying to make. I don't condone theft. But to
claim there is a _loss_ in the case I cited is clearly stretching a
point. It may not be right, but there isn't a loss to the software
author because he wouldn't have sold that person a copy of his program
anyway. And no, I don't believe Photoshop would be 50 dollars a time
if we wiped out piracy tomorrow. Or even 100.

That's a completely bogus claim. No law prohibits accepting a return on software (and, in fact, a number of laws that require a product be of suitable quality for sale actually require it.) What the laws do require is that a product (not just software) accepted back by a retailer not be resold AS NEW. Many stores completely disregard this regulation and resell the returned product (many even go to great lengths to point out that they are going to do it, WalMart was very clear on that recently with me when they checked all the paperwork that came with a camera saying they needed it to resell the camera [it was all there]). There certainly is no law that keeps a store from accepting a return and sending the product back to the manufacturer for credit; they just don't want to do it.

Sorry to have offended you Walt, but just stating the facts here. If you are gonna write the stuff and charge for it. Support it properly!!!!! And this isn't whining about it either, just stating another fact. I do pay much more for other software, it isn't beta version or half written stuff that any high school kid could write either. And yes, I do have software written by hams and have paid them for it.. APRS is one of them from Bob Bruninga, WB4APR. So don't spout that phony baloney whiney crap to me. It don't fly at all around here.

Fred KE8TQ

I may not always agree with what you say. But I will defend to the
death your right to say it.

Isn't "Flight Simulator" $40 software? To return that, I'd have to ship
it to MS, as well as make a toll call to work it out with them. 99% of
the time I buy from a retailer, and they don't take refunds. In addition,
many software vendors will void their warranties and policies if you
purchase it through a 3rd party.

That's because most stores are required by law to not accept refunds for
opened software.

Unfortunately Jeff, the two are not equal.

Software (at least a bootlegged copy) is an intangible item.

The Porsche in your example is a tangible item. By my "theft" of it,
I deprive you of your ability to use it.

The same is not true of the bootlegged software. By bootlegging it,
you do not deprive someone else from using it.

Akin to your example, if I see your Porsche and decide I like it and
want to use it, and thus make my own copy, deprive you of yours?

Not that this makes the behaviour correct, mind you, but comparisons
to tangible property examples are simply not appropriate.

Wow! This is great! There a lots of things I can't afford! Gonna go grab some of that right now. And maybe if I scrimped and saved I *could* afford it, but as long as the line is not clear cut, I may as well bend the rules a little bit.

"Not being able to afford it" is my ticket to riches!

I have for sale an AEA PK-900 Multimode TNC with the factory 9600 baud modem installed.Excellennt condition, includes all manuals, cables, etc. This unit runs all HF modes, VHF Packet at 1200 or 9600 baud, and works all 9600 baud packet satellites (that's what I used it for) such as UO-22 KO-23 and KO-25.Works well with WISP.

Cost over $500.00, sell for $350.00 + shipping.

465. Can I copy a text file to body of a packet message

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-22 00:00:00 UTC
From: "Steven Pituch, N2MNN" <N2MNN@OPENIX.COM>
Message-ID: <32E62626.664B@OPENIX.COM>
Source record: 32177

I am relatively new at using packet. I am using a baycom BP-1 to advertise the sale of ham equipment for the widows of silent keys to help them from getting ripped off (I do this for free). I was told to send a new BBS message every day to SALE@USBBS and kill the previous message. I guess people don't browse the older messages. This seems to be more effective, but is very labor intensive, as I must retype each message every day. I tried using the SC command to resend the older message before deleting it. It works but the my call gets added to the front of the subject and after two days you can't read the subject. My first question is whether using the BP-1, I can copy a text file to the bidy of a new message. I'm using Win95 right now, but can use anything including Nt. The baycom software works fine in the full screen mode, but when I put it in a windowed mode and then open up Notebook to cut and paste the file, I loose my packet connection. Is it possible to copy a file to the body of a message when using a BP-1? Is there a packet TNC/software combination that will let me do this? What is the cheapest used TNC that will do this?

Also I know that hams can advertise the sale of their own equipment on packet. But I've heard of SYSops deleting messages when in their opinion the senders look like they're advertising for a profit making business. The problem is that I was just contacted by another widow, and I estimate that about $5000. worth of equipment must be sold. I don't want to do anything illegal, or get any SYSOps upset. Is there anything I should do to prevent problems?

I hope these subjects are appropriate for this net.

Thanks,

Steve, N2MNN

Should that poor student borrow your car just because he wants
transportation? This half baked rationalization is what is costing
everyone more because the software vendors must take into account all of
the thieves.

The same folks who argue that piracy is not stealing are the same who
believe that porn does not exploit and cheating on taxes does not hurt
anyone. You most likely apply the same bs logic to your job and then can't
understand why business isn't great.

Mark

> BOX). SBFFT is like this.

The "other" problem is that Win95 still seems to "own" the
soundcard when you are in a "DOS" box. The program does not like
that. You will get an "interrupt" error or similar.

Make sure himem.sys is loaded in your config.sys and "emm386.exe
auto" is in your dosstart.bat. Exit windows with the "restart
computer in dos mode" menu. You will then drop right into DOS.

I have had good success with it. It works! I got a perfect copy
tonight using a DX-440.

Pentium 120
S3 Vision 330 PCI 2MB
Soundblaster 16 value PNP
64 Megs RAM
Running Win95's stock EMM386.exe and himem.sys

640x680 and 600x800 worked fine, 1024x768 seemed to revert back
to VGA.

Unless you have a "magic" soundcard, you will probably have to
tweak the <esc>/Settings/Demodulator/Clock-cal setting.

Type <ESC> S D C

At first, I got a screen-full of scrambled lines. Totally out of
sync. Slowly decrementing the value, I got it to "straighten
out". It straightens out all the stored data, too. So the whole

image should "snap" into place.

My final clock-cal setting was 0.98698. You may need to step in
increments as little as 0.0001 to "zero" it in.

Good Luck!

Greeting and thanks for reading this posting.
I came upon a weird problem with my pk-232, things were running fine
until yesterday, now I cannot initialize my pk-232 with either my
macratt or pcpakratt software. When I turn on the pk-232 the 4 leds
nearest the tuning bar light up but nothing else lights up after that. I
reset the pk-232 by pulling the battery jumper under the case. I also
tried (carefully) putting in old firmware chips but di not get any
results. oh, i should mention that at first startup the pk-232 did have
both stby leds lit up after the 4 leds.....Thanlk for any help you may
have

473. smt 160-30 ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-22 00:00:00 UTC
From: venterml@telkom30.telkom.co.za
Message-ID: <5c54l8$eka@news1.saix.net>
Source record: 32252

Hi there,

Some year or so back I pulled an article off packet (I think from
OH9MV@OH9RBA.FIN.EU)
It was a little program called x-temp, using the SMT 160-30,
a sensor with a built in A/D convertor. This is connected directly to
the
par. port.

Specifications were givin as: input v = 4.7 - 7.0 v (typical 5v)
current consumption =
<200uA
Range = -30c to =130c
o/p freq = 1-4 kHz

Problem is, I have not been able to find any reference to this
device,
neither do any dealers/importers know of it. I sent a message to
OH9MV on
packet but never received a reply and now I am not qrv on packet
anymore
either. In the article the heading is SMT 160-30 however all
through the
rest of it he talks about SMT160-30, I have not been able to locate
it with
net searches whichever way I spell it. Please if you know of it or
any
similar device which will operate over the same program (x-temp) give
me a
shout or reply to this newsgroup.

Thanks
Mark - ZR1MLV

> William A. Wetzel

Piracy doesn't affect the support a software maker gives. This is
nothing
but an excuse to steal.
I don't know of any software makers who don't offer a money-back
guarantee.
While some *vendors* may not give your money back, if you contact the
maker with a problem, they will give your money back.

Those who feel a "try before you buy" deal is best, this is what
shareware
is about.
If shareware isn't your cup of tea, join a user group. The members will
have tried almost all applications, and can help you make a decision.

Piracy is theft. It raises the cost of software for those of us who
don't steal. It steals the work of many people.
There's no excuse for it at all.
To defend it is like defending rape. It only makes you look stupid.

Bill

Stretch this a bit further and you are saying if the same poverty
stricken student steals a Mercedes Benz, Mercedes didn't lose anything,
as he never would have bought one anyway... Let him keep it...
Theft is still theft. If you can't afford it, you can't afford it. It
doesn't mean it's OK to steal things you can't afford.

Later,
Dave

What kind of cottonheaded logic is this? Justify stealing something
because you can't afford it?

Kory,

A few years back mine quit working also. I orignally suspected U19 and U20 (reference the schematic in the manual). I replaced them and it still did not work. Then I measured the + and - 10 (+10D and - 10D) volts going to U20 and found one of the voltages to be wrong. Traced back to the U13 circuit and found one of the diodes D3, D4, D5 (can't remember which one now) to be bad. Replaced the faulty diode and the TNC started working. My symptoms were that the unit would send characters on power up but would not accept commands. You may have to do some toubleshooting but it is probably in the areas discussed. Hope you find it.

When you consider that most software is made and sold by large corporations, it's a little hard to feel sorry for them. Especially after one has been downsized because some schmuck in upper management decides the company has a tummy ache. Most software authors are just employees, just like the rest of us.

Recently saw on PBS a debate on what's wrong with American industry, someone from Japan comments that American companies have killed any sense of loyalty from their employees. No shit Sherlock, after all these damn mergers and takeovers and downsizings. Give us a REASON to be loyal.

Hard to think morals with companies that act amoral to their employees. Legal, yes, moral, no. I support the Korean workers in their protests. Give me a little respect, and then I'll worry about your copyrights.

I took the liberty of changing a few words (see below) to show how
ridiculous (and dangerous) beliefs of this sort are. God help our
society.

Stolen car = bootleg copy
a Porsche = Photoshop
car = copy
stolen one = bootleg
cars = software

Overwriting drivers? Sounds like your problems are self inflicted. Maybe you need to have a clue as to what your doing, before you start installing that pirated software.

Phil,

Is this documented someplace? I've seen several pieces of code that I wrote
years ago floating around on ASP tables at hamfests. The sellers will tell me
straight up that they have 'the authors' permission. I must have amnesia, I don't
remember giving 'permission'. Only one guy who distributes it had my permission,
because he was polite enough to ask.

Hi Steve
I hope that u solved ur problem.. mybe i am too late..
-> macratt or pcpakratt software. When I turn on the pk-232 the 4 leds
-> nearest the tuning bar light up but nothing else lights up after
-> that. I
my dear u did not mintioned that 4 leds stand still and keeps light up
or not..??
i had same problem many years ago and the proplem was that power and
amps are not sufficient .. i was supplying it from a small adapture.
then i connected it to my power supply then it works great..
hope that ur proplem is over,

This is a very lame arguement, and what you are basically saying is that copyright laws in general are not legitimate. You may feel that way, but that is the law of land!

485. Sat Weather map questions... questions ...questions...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-23 00:00:00 UTC
From: helling@uwindsor.ca
Message-ID: <E4G806.7qM@news.uwindsor.ca>
Source record: 32185

A few questions on the fine points of weather satellite image reception...
(on a shoestring budget.......)

I have read the article in Nuts and Volts, picked up the LM741 fuzzbox interface for my Pc (it does reemble a crude guitar fuzzbox effect...what an odd way to get square waves!!!!)

My ancient heathkit GR-64 has a BFO, am bust dusting it off, Won't hook the mess up until I get an isolation xformer for the patch...

AND.... Tadah.... just scored an ancient Radio-shack PRO-33 20 channel scanner for that all-important 137 MHZ reception... As the scanner tunes in 5KHZ steps, it might even tolerate the reported doppler shift...

SO......
1) Assuming I find an antenna, will the little 741 interface and the shareware program for weather fax I got with it do the job for 137 MHZ reception ?

2) the Nuts &volts article has a diagram of a double crossed dipole antenna. Bottom cross must be grounded as "reflector", right? Top one is PVC and wire along the sides, just like the ancient RLL handbook design... OK. but what length??? The formula in my 1970 Arrl book doesn't look too useful over 50MHZ or am I banging the calculator wrong???

Any suggested lengths???? Got baling wire o plenty...
(then off to the cable co dumpster for coax.... and away we go...)

3) I am really interested in the High Orbit 1691 MHZ sat images... But that $US600 downconverter.... ulp...
On the other hand, I garbage picked an old sat reciver a while back (swapped it off.... they aren't worth much if they don't de-cypher) Now.... hmmmmm..... Conversions anyone???

3B) Those really cheap mini-sat disk systems being sold to hook one in to paying subscription fees forever.... wonder how modifyable these are....

Ok...at this point my ignorance is REALLY SHOWING, but heck... one week ago I was ripe for a Ramsey 137 MHZ kit (fortunately I am perpetually broke), and then I pick up the scanner at a 2nd hand store for CAN$30.... As a bonus, I get to hear the

walky-talkies at macdonalds 4 blks away (YAWWNNNNNNN!)

This sat stuff looks great.... (I used to mess with
electronics and DX a bit, went to University, got useless
degree, decided to have FUN, went to ART school, got a REAL
USELESS DEGREE, and now do gallery sized set-ups involving
wonky technology... Still can't draw worth a %$&....
So what If I recycle a few sci-fi plot lines here and there...

TRY this....
Sat receiver => computer => stored images scripted to slide
show mode, adding latest image to end => cheesy VGA-2-video
coverter => rented scan rate doubler => rented video projector
high up projecting on the floor of a darkened room...

OOOOHhhhh..... View from a height....

The pro sat pictures from high orbit would be best, but the
low orbit ones are a good start...

Any tips, sites, advice, apreciated big time...
Thanks & regards.... B/H
helling@server.uwindsor.ca

Yet that is exactly one of the reasons the Home Recording Rights
Act was passed which allows you and me to make audio
copies of musice from the radio, from another cassett, from
a CD-ROM, etc. as long as it it for personal use. The music
industry claimed huge losses from illegal taping, but
it was shown that tho taping, even if it was stoppable,
was not going to cause hugeadditional sales at all because
most tapig was by teenagers without the discretionary income.

Don't kill the messenger here just because you don't
like the message. Review the legislative background
involved in that copyright change.

Hi Mark,

if you are looking for a TCP/IP sys running under DOS, there is a variaty of "NOS" systems. Personally I prefer wnos, but there are a couple of similar systems like jnos etc.. They all derive from the ka9q original as far as I know.

There are also different prgs. made for Linux. In that case I prefer the "wampes" software because it has a handling which is similar to the handling of wnos.

Yes you need an IP. Typically there is net coordinator responsible for your area, who picks an IP for you and will send it to UCSD.EDU.
For test purposes you can try a 44.128.yyy.xxx number.

I got my soft from ftp.funet.fi, but there may be a closer server in your country. Try your crawler's or xarchie on wnos or jnos or wampes (linux)

Hope it helped a little

bye and 73's de Peter dg2ebj [44.130.19.29]

Actually you wouldn't. No one would pay $1000 for a terminal program,
so your return per hour spent would be $0. It doesn't matter how much
time or effort a programmer puts into a piece of software, it is only
worth what people are willing to pay for it. That hinges on its perceived
value *to them*. This is Marketing 101.

Most ham software has a low perceived value, so it will never command
a high price. That means that you have to A) put little effort into it,
or B) get a *huge* distribution in order to make a profit on it, or C)
you have to accept you're doing it as a hobby and release it to the public
domain.

If your laptop does have a soundcard and a newer processor (starting
from a 486DX2/66), you can use your soundcard as the TNC/Modem.
Take a look at http://home.pages.de/~flexnet and
http://www.ife.ee.ethz.ch/~sailer/pcf/ for DOS software (PC/FlexNet)
or your favorite Linux kernel archive for a Linux driver.

Unfortunately, what you say here is true. Loyalty is a two way street.
If the company isn't concerned about its employees, its employees won't
be concerned about the company.

>if we wiped out piracy tomorrow. Or even 100.

Right, they're cream skimmers. They make their money from sales to
the Fortune 500. If they lowered their price to the range where Joe
Shmoe could afford it, their corporate customers would demand the
same price break, and their profit would fly out the window.

But someone might decide to offer a lowball program that does most
of what Photoshop does for under $100 if piracy hadn't destroyed
that market niche. That would fall into Joe's price range, *and* it
would attract the Fortune 500 buyers too. Photoshop wouldn't like
that. So they make it easy to pirate their software.

That doesn't excuse piracy, of course, it just shows that some of
the software vendors who scream about piracy are really hypocrites.
They've taken advantage of piracy as a way to maintain an anti-
competitive position in their core market.

If you had bothered to read the rest of the article before spouting off,
you'd have discovered that I do not use this as a justification for violating
copyright. As someone with copyrighted works of my own, I am sensitive to
copyright issues. I was addressing the very specific point that piracy is
not a direct loss to either the person whose software is copied, or to the
software's author. This is very different from the theft of an automobile,
which the person to which I was responding was attempting to liken it.

Auto theft causes a direct loss to the owner of the auto, but ironically is
a net gain for the auto manufacturer since he gets to sell a replacement
vehicle. Piracy represents no such direct loss to the person whose software
is copied, and in most cases it represents no loss to the author of the
software either since the person committing the ripoff wouldn't have bought
a legitimate copy anyway.

I then went on to note that some software vendors subtly encourage piracy
as an anti-competitive measure to maintain their market position in their
core market. When they scream about $20 billion in losses due to piracy,
they are being hypocrites as well as playing fast and loose with phantom
sales numbers. The truth is, most ripoffs don't represent lost sales. The
reason for that is because most ripoffs are committed by people who only
want to "play" with the software, and wouldn't have paid the inflated
price of a legitimate copy for mere play. (Now commercial ripoffs are
a different matter, and software vendors *do* treat those seriously because
they *do* represent lost sales, but they are a small part of the piracy
problem.)

Try these..

145.05 K6GWE
145.73 sonoma or kc6pjw
I think KJ6FY is on 145.05
there are SEVERAL others between 144.9 and 145.1 just search around and
you will find a few good signals.

Jim..

We all have to start somewhere. What this proposal gives us is a
much larger base of potential experimenters because it doesn't
require the purchase of specialized single purpose hardware. A
person can first learn C programming, if necessary, before tackling
DSP because the hardware doesn't demand that the person start out
immediately coding DSP applications as the specialized hardware
platforms do. This allows the non-specialist to gradually acquire
the necessary skills, IE work his way through the "hello world" stage
without the double compexity required to do anything with dedicated

DSP hardware. And most DSP algorithms don't require advanced coding
tricks anyway, so a detailed specialist knowledge of the programming
language isn't needed to do useful things.

>>The hardware base suggested is sufficient to achieve markedly better
>>performance than most available hardware solutions for *voice grade

>longer that optimistic about what they are going to do for packet radio
>modems...
>(of course I was enthousiastic when I first heard those lectures about
>experiments with multitone PSK modems, but where are they now?)

Two points. How many DSP-4 cards and TAPR DSP-93 cards are in the hands
of experimenters? I'd suggest only a relative handful. Now contrast that
to the number of sound card equipped PCs in the hands of potential
experimenters. I'd say that at least an order of magnitude more people
would work on a sound card application than have been working on the
dedicated DSP platforms, if a skeleton framework of code were available
for them to use as a starting point. That would be the task of the initial
group we are talking about forming for this project.

Second, multitone FSK faces a regulatory barrier here in the US which
has inhibited its full application. The best known systems require at
minimum 2 kHz of bandwidth, but we are limited to 1 kHz by regulation
for HF data modes in the US, 500 Hz if the station is automatically
operated. (Multitone doesn't offer us any useful advantages at VHF and
above for terrestrial work, though it does offer promise for EME, and
some work is being done in that area here.)

>has only increased over time while we were kept at the same 9k6 rate)"?
>Of course I know some explanations for that, but not all of them are
>completely unsolvable.

The problem is mostly one of how to achieve successful training in
a contending simplex environment. If we want to go to nailed up
non-contending duplex links, we can just adopt telco technology.
That's basically a solved problem. All we have to do is throw off
the shelf radio hardware at it. With the available UHF+ spectrum

we have, however, it is more cost effective to use a dedicated RF
modem with a less sophisticated modulation to achieve high speeds.
For low SNR paths, however, we have scope for development of DSP
solutions, at necessarily lower speeds, Shannon won't be denied.

>We (in the Netherlands, also in the rest of Europe?) at least seem to

>to condemn any limitation to hamradio message content or source
>identification found in other countries as censorship :-)

Well, I won't touch the latter topic, but I'm glad to hear that
you have no artifical baud or bandwidth limitations. Below 33 cm
we do. And they are particularly onerous on HF where we are limited
to 300 baud and 1 kHz bandwidth (500 Hz for automatic operation).
Above 33 cm, we also can use any baud and any bandwidth which fits
inside the amateur band.

Unfortunately, what you say is true (especially the bit about Dxers
inappropriately using an amplifier). That reflects the Dxer mentality
of competition rather than cooperation which is so antithetical to
data networking. There is also the fear (legitimate in some cases)
of missing a spot because of lack of positive acknowledgement of
delivery. Failing to achieve timely delivery is a fatal flaw for
this application, so the connected mode has value even though it
is wasteful of channel capacity.

>>And typically, a BBS will download the same bulletins again and

Well, I think it is chicken and egg. If there are no applications
requiring multitasking capabilities, people won't be motivated to
switch from their old single threaded systems. Linux has removed
the excuse of cost, but it still seems complex to someone not familiar
with it.

>An other problem with the BBS forwarding traffic is that no one is

>preferable.

Yes, I agree to an extent, though I do see users reading every new
message on a BBS every time they connect. I don't think many of the
users around here have gotten selective in what they download. Thus
your proposal may not represent any resource savings at all unless
those habits change.

499. POCSAG Database - New version announced

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-23 00:00:00 UTC
From: Dave Evans <Dave@devans.demon.co.uk>
Message-ID: <OjrLEOAYW85yEw6Q@devans.demon.co.uk>
Source record: 32199

New release of P-Base

Version 1.01 corrects some problems reported in the initial release and improves the PD import feature.

If you are evaluating P_Base, upgrade to Version 1.01 by downloading the new version via my Homepage "http://www.devans.demon.co.uk", (or add "/p_base.htm" to go direct to the P_Base page).

Regards,

Dave Evans

: drive the program at his or her site to see if you like it? This
: would be the ONLY legal way to do it, and it keeps you from
: cluttering your disk with useless junk.
:
: I don't buy into the 'I've been burned before' bull, although it
: would be a rather cute justification for these illegal actions.

Well, let me say, "I've been burned before". "it" looks good on the
legitimate owner's computer, so i went out and bought "it" and "it" turned
out to be a piece of crap. The day it happens to you will be the day you
won't think it's bull anymore..

I had Doom 2 on my computer for a couple months before I actually went out
and bought it. And if you buy it in the long run, i don't see the problem
with it. I've done that with Doom 2, Quarantine, Telix, and a load of
other software. I really like the shareware concept, and in the event that
a product isn't shareware, personally i "make" it shareware and try it out
for a bit.

You could say that stealing a car is bad even if you pay the price of
the car afterwards, and that you even had the opportunity for a test
drive. But if you've driven 2,000km on the car and then you realize it's a
lemon, you'd be wishing you had a longer test drive.

anyhow, i think this issue has been heard a bit too much on the Net, so..
i won't say anymore on this debate :)

I have used a PK232 for the past 6 yrs with no complaints. I know of
three hams who were unable to use a Kam Plus for Pactor with their HF
rigs. While one of the rigs was a Kenwood Marine Band Model, both the
others were production amateur band transceivers (Icom 735 and Knwd
TS830. So, I sure wouldn't recommend the Kam for Pactor!

503. Help with PK232MBX

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-23 00:00:00 UTC
From: Kory Hamzeh <kory@avatar.com>
Message-ID: <Pine.BSI.3.91.970123125055.10965A-100000@avatar.avatar.com>
Source record: 32203
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

My PK232MBX just stopped talking on the serial port the other day. I can cycle the power and the LEDs go through their normal startup sequence and it goes into the last mode I has it in, but nothing is transmiited from the serial port. I can tune rtty, and the tuning indicator work correctly. I thought it might have been stuck in host mode, but it is not (I sent it the proper escape sequence).

Any ideas on what might be going on? AEA, of course, is not around. Althought I heard someone purchased the TNC line from them.

Any suggestions for replacements? I work RTTY, AMTOR, PACTOR, and CW. SSTV, WeFAX and NAVTEX would be nice.

Thanks,
Kory

Message-ID: <32E7FDA8.565F@concentric.net>
Source record: 32204

>SOB

Have you met my mother?

A debug script for the Hamcom 3.0 has been around for some time.
Everyone asks for it from me for some reason. All I have done
is give the ability to steal to others. Is a Gun dealer a killer?
If you thinks so your a Democrat!

As for craking code, I know Asm, and have programmed with it
for over 15 years now. The Hamcomm software is no great feat,
niether is the 3.1 version.

I'm one of the hackers who busted the Video Cypher II, That caused
the programmers such as HBO, ShowTime and others to make their
Programming available at better prices to the satelite customers.
I have not hacked the VC2plus for that and other reasons.

I have distributed shareware software myself, some of it real
good stuff. I have not received a penny for it. IT DON'T WORK!

Last year I created a serial port driver for the Clipper Programming
language. It beats most comercial versions on the market and
included a copy of XMODEM source with it(I wrote).

I did not make the Library shareware I made it FREE ware, and the source
is avail to anyone who wants it. All I asked was to send me Email, a
good or bad message it did not matter. There have been over 2000 down
loads from one site alone, I only get a comment now and then when a user
has a problem.

As for Hamcomm, this dude in GB sells the thing for more than $40, it
cost about
$7 in parts to create the thing, I'm asking about $8 for my time of
putting
it together. People buy the thing from me because it is a very
inexpensive
way to get in to digital radio. If the software did not exist I would
have created
it anyway.

AS for Shareware! I HATE TEASER software, (pay me and I'll send a real
version)
Either advertise and sell the software, give it away free or SHUT THE
FUCK UP!

I make real software for companies that pay me, I support it and we are both happy.
When I create software for the public on the NET, a local BBS, etc. Its FREE, I donate
to the comunity. None of this TEASE stuff, I met plenty of girls like that in the local
bars and I'm sick of them, I don't like the idea of it on the NET.

I have removed the HCREG.COM software from my page because of all the flack, but
advertising it here has only caused an overload on my page, every one wants it now.

I have an idea of how the original programmer and I can both make money, all he has
to do is contact me.
N9ZLE

505. Re: Software Piracy, anal retention

Newsgroup: rec.radio.amateur.digital.misc

Software is priced too high!, I gave better stuff away free.

I'm not going to pay a dime to any Basic programmer who thinks
he is hot stuff. Most large commpanies have defeated the problem
with OEM versions of their software, $15 dollars to MS for Win95
is better than a dealer shipping a hot copy with a CPU.

Did you avery wonder why you can buy a $1,500 Computer and get
about $600 worth of software with it.

If I just had more time.

I'm working on some VERY GOOD Ham study software that will create
Test pages, teach etc. All graphics included. It will be FREE
on the net when it is ready. I expect to put it on the market
after the new NOVICE/TECH question pool comes out this summer.
It will beat most of the stuff you can purchase and I will
give it away FREE, just to make a name for myself.
If anyone wants to sell it at a HAM fest, all they have to do is
tell me, no royalties, no cash it will be free.

Bruce

A few years back, if I remember correctly, I had a similar problem
that I traced to the MC1488 and MC1489 chips. Also, lost a serial
port on my computer once that caused comm problems. Couldn't tell for
sure from your message if you were getting communications going both
ways from the unit. 73. Jack -- W0FNQ

Or, D) Release it as shareware, but realize that it's mostly a hobby
and it's unlikely you're gonna make much money with it. This is what
most shareware authors do.

As long as we're on the topic of shareware... I would say that 99% of
shareware authors neglect the quality aspect (yes, I mean 99%). In
order to really make some money with shareware, your program has to be
TOP NOTCH, that is, better than most commercial software. The
reason being, of course, that people have a chance to try it before
they buy it, whereas with commercial software they usually don't.
Most REALLY outstanding shareware programs make a lot of money for
their authors.

512. HARC Winter Carnival Special Events Station

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-24 00:00:00 UTC
From: jdhaas@mtu.edu
Message-ID: <5cajt3$mgr@login.ee>
Source record: 32114

Hello there. I am Jim Haas, KG9IF, QSL/Contest/Awards Manager for the Husky Amateur Radio Club, W8YY, which is the amateur radio club of Michigan Technological University in Houghton, MI. Every year over a festival known up here as Winter Carnival, where everyone takes a couple of days off to enjoy the snow (we get a lot of that up here), we run a special event station. This year's station runs from 1100Z on 30 January 1997 (6:00 AM Eastern) to 1100Z on 1 February 1997.

"So Jim," you ask, "what do I get for working this station?" Well, if you work our station, just send us a self-addressed, stamped envelope suitable for holding a certificate and we will send you just that--a really nice certificate that says you worked W8YY over Winter Carnival.

Below is the frequency list, which is a general guideline and not a promise of where we will be. I can guarantee one thing--if you look around, we will be there. We may not be on, for example, 14.325 exactly, but we'll be on 20 somewhere. We may also do some HF digital modes (we still need a few connectors for that) and some satellite work as well. If there is enough interest among the station ops/control ops, we will work some CW as well.

If you have any questions, comments, or criticisms, just drop me a line at jdhaas@mtu.edu. We look forward to hearing you on the air.

73 de Jim Haas KG9IF

Band Mode Frequency
17 M USB 18.130.0 MHz

20 M USB 14.325.0 MHz
CW (maybe, if
there is 14.130.0 MHz
interest)

30 M CW (if there 10.125.0 MHz
is interest)

40 M LSB 7.262.5 MHz

75/ LSB 3.972.0 MHz
80 M

160 M LSB 1.932.0 MHz

Tom:

Because we have a bunch of thieves among us who actually use ham radio to facilitate software theft. You ever hear over the air: "Oh, you like that program? Why don't you send me a copy?".

And we have further miserable SOB hams who rationalize the practice by saying "So what if we steal it? We're only hurting 'big business', who is always taking advantage of us pathetic, helpless little guys".

So the thread is to raise awareness and save us from ourselves, hopefully setting a bit higher standard.

Sounds like you've lost a RS-232 line driver chip. A quick look
with a scope or logic probe will tell you. DigiKey stocks the chips,
the repair is simple. If your setup is subject to surges, you might
want to install a socket for the chip because you'll be replacing
it again.

<snippety>
> Steve, N2MNN
> n2mnn@openix.com

Steve, yes you can cut and paste from windows applications such as
notepad and MS wordpad and write etc, do the usual CTRL-C thing to copy
highlighted text in the notepad or whatever, then click on the upper
left hand corner of your BAYCOM window, in mine I have a little computer
icon in the upper left hand corner to click on, and a small menu drops
down that includes an "edit" selection, which if clicked on, will allow
you to paste. I tried it with selections cut from your newsgroup
message and it pasted right into the transmit window following the
procedure I just described and it transmitted right out.
Also, if you get all this done soon enough the packet connection should
not drop out. The key is to QUICKLY click the baycom window back to the
FOREGROUND. It will receive but NEVER transmit so long as it is in the
background, thus if left in background too long one of the stations (you
or the other end of the connection) will retry out and disconnect. you
might check your own RETry setting and double it if necessary to prevent
your own system from dropping the connection too quickly while it is in
the background mode.

Correct - this is the same logic the cellular carriers and landline phone companies use to justify the 'billions' lost to hackers each year. They base the 'losses' on POTENTIAL revenue from system usage. Never mind the 'little' fact that the usage never actually occurred.

A famous Bell South case had the company claiming 'millions' in losses. As it turned out the information they lost was publicly available for $79.00 from a unit in their own company.

It goes to show you any numbers put out by these companies should be scrutinized a LOT more closely ! The methods used to inflate losses would be thrown out by any competent auditor.

The piddly little onesy twosy user - most people on this group, is not the problem. The problem are the operations that counterfeit/copy 1000's or ten of 1000's of software titles at a time, and sell them overseas....

Greetings

The AEA DSP-232 seems to be an OK device. I primarily use it for packet (vhf/uhf) at this time. However, it seems to put out some sort of signal from 145.085-145.095 mhz. Just strong enough on the local packet frequency of 145.090 that I can only hear those stations that exceed the 'noise level' eminating from the unit. Has anyone resolved this issue, now that AEA is apparently no longer around?

Many thanks

John

I have a freight-damaged Kenwood TS-440S in need of a control module, display module, etc. Does anyone have a TS-440S that may be otherwise broken but have working display and control board? Or, can someone suggest a source of parts in San Jose, CA or vicinity?

I have already gotten pricing from Kenwood and Pacific Coast Parts, but am almost at the point of having to replace the whole unit because the cost is so high. I'd really rather get the unit running.

Thanks,

539. MFJ-1278BT PPT Keying Problem -- HELP!!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-25 00:00:00 UTC
From: Mark Saunders <tracker@dancris.com>
Message-ID: <32EA4C31.6C5@dancris.com>
Source record: 32064

Okay, this is my problem. When I power up my MFJ-1278 TNC, it takes several minutes before it will acitvate the PTT line. Once "warmed" up, it keys the PTT fine. It appears to be more a problem on cold days, not that we have that many cold days in Phoenix, but it only happens when it is cold. I'm keying an FT-530 Ht. I've used a friends FT-530 also and the problem still exists, so I know it is not the radio. Once it is "warmed" up, I can power OFF and ON the TNC and have no problems. It only appears to be associated with a cold TNC.

Any help is appreciated.

Best Regards,

I would be pissed by this also, Django.

I have seen guys throw together the little interface (per your design)
and sell the interface at hamfests at a ridiculously high price while
simultaneously "giving" a copy of your Hamcomm with it. Perhaps you
should re-write your license agreement to require a royalty payment
when it is packaged this way.

I don't use your program, but did play with one of the early
versions, and I was really impressed with its quality and usefulness.
I have recommended it to others trying to get started in the digital
modes. I don't know how much it has enriched you, but I am pretty sure
it has enriched Ham radio quite a bit.

I think if I were in your position, I would enjoy the challenge of
including code that the hacker thieves could not break. Also, by
including significant feature upgrades in new editions it should be
possible to stay ahead of the thieves.

Anyway, I hope you continue to contribute to the ham community as you
have in the past. I hope it will continue to be with shareware

versions of your product.

I'd strongly recommend against it. I bought one last year, thinking to add a second RTTY radio for contesting, keeping my KAM as the other one. The DSP-232 was a terrible disappointment. I ran a side-by-side comparison with the same audio fed to both and with both tweaked for optimum performance (careful matching of MARK and SPACE tones into each). The KAM easily outperformed it, especially on weak and fading signals.

Needless to say, it went right back to the dealer. I had to pay shipping both ways of course plus a re-stocking fee for a net $60 dollar learning experience. I figure AEA owes me.

From my Oxford (ugh) dictionary - "Piracy 2. Infringement
of rights conferred by a patent or copyright (1771)."

>... It makes YOU look stupid to take a simplistic viewpoint that
>"piracy is theft." It is a complex issue, and it will never be solved
>without realizing this.

To the Oxford again: "Pirate v. 3. To appropriate or reproduce the work
or invention of another without authority, for one's own profit (1706)."

Gee, 1771 and 1706 - these are pretty old definitions.

Which still has nothing to do with the rec.radio.shortwave topic. But while you're raising awareness, let me suggest another bit of awareness that needs to be raised: Most shareware is worth exactly what you paid for it BEFORE you registered it! For years I've watched shareware "authors" whine and complain that there are lots of downloads of their files, but almost no registrations. When I've looked at the software written by the whiners it has become abundantly clear that spending 32cents to mail in a registration would be overpayment! Their "software" gets quickly deleted from my computer. There are some exceptions, of course. But you won't hear or see the authors of the exceptions whining. They're too busy driving to the bank to deposit the registration fees.

I know of no available "statistics" but do know of software publishers that
use estimates of the number of pirated copies to determine the suggested list
price (or selling price) of their software.

>>It steals the work of many people.
>
>If the person who pirates a program didn't intend to buy it anyway,

>
If I steal the fruits of your labor (or just refuse to pay you for it) then
you are not losing anything if I never intended to pay you. Right? Also,
although it isn't completely comparable, if I drive off with your car (and
later return it) then there is no crime if I did not intend to buy or rent
it.

You don't need to respond to this since you obviously have no concept of
morality or ethics.

Isn't it a little more like the poverty stricken student makes a COPY of the Mercedes Benz, and uses it? In your analogy, the owner of the Mercedes would no longer be able to use the Mercedes - that IS theft. In this case, however, Mercedes wouldn't be out a car or a sale.

I disagree with software piracy, but feel that the cost of the piracy is often rather exaggerated by equating every illegal copy with a lost sale. Many would never have been made at all at the regular price.

I used my KAM+ with my TS-830 with no problems on Pactor and the other modes.
Currently using it with an IC-765 on all modes with no problems.

With AEA out of bussiness it does not make sense to purchase one of their
products.

It's simple working in DOS mode.

Save your message as a text file.

When the header is "logged on", just type :read <FILENAME> and off it
goes.

I don't know whether the same procedure will work in Windows. I stick to
DOS for packet (DOS 6.1 and BAYCOM 1.6).

I had problems with my unit also. My problem is the crystal oscillator
that provides the boud rate clock for the seial port. The factory
said to replace the crystal but I changed the value of one of the
capacitors at the crystal and that got the oscillator going
again. Check for the clock for the serial port. If its not there
you have the same problem as I did.

Hi Jerry -
I'm going to reply directly to your comment as well as insert some
general
remarks into the thread.

Regarding your comment on "ridiculously high prices" - until you have
actually
developed your own kit or assembled product you can't believe what an
incredible time sink it is and how many unforseen costs you run into. It
really
is a mistake to look at the bare parts cost, add a 15 or 20% profit and
expect
that the unit should sell for that amount.

Secondly, for reasons that I'm not sure I understand, Bruce (N9ZLE) sent
me
an e-mail the other day regarding the hc patch and did not post it in
this

thread (or at least I couldn't find it). Basically, he presented his rationale
for
posting the patch in the first place and said that he was removing it from
his home page. As I understand his rationale, it was that the patch was for
HC 3.0, and with the release of 3.1, he didn't think that hacking into 3.0
would impact any 3.1 registration sales. Whether or not you agree with
that rationale, Bruce should get credit for removing the patch.

Kory,

You might want to look at the KAM Plus. AEA is currently out of business. The KAM is a very good unit, low power (300 ma), can do mail forwarding (not just reverse forwarding), on HF, you can set MARK/SPACE tones with commands, CW decoding algorithm appears to work better than the AEA decoder. The filtering (DSP vs. Analog) in the KAM is a hybrid -- SCAF -- Switched Capacitance filters (the Yaesu FT-990 made quite an issue of being the only HF rig with dual SCAFs in their high/low cut audio filter. FYI == the KAM has 6 SCAFs, bandpass and high/low cut filters).

Kantronics has not touted the SCAF technology much, in fact, I've tried to encourage Phil Anderson of Kantronics to give more attention to the technology used in the KAM in their advertisements. Despite considerable hype from the DSP vendors, DSP doesn't really add that much to the successful decoding of Mark and Space tones. DSP really pays off when signals are encoded with phase, amplitude, etc., but Mark/Space discrimination is handled fine with any of the filter technologies. As a result, the user might want to look at other features (modes supported, mailbox features, cross-connect capabilities, price, etc.).

586. Mark / Space Inverted transmit

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-26 00:00:00 UTC
From: Costas Spanos <spanos@eecs.berkeley.edu>
Message-ID: <32EB9B49.167EB0E7@eecs.berkeley.edu>
Source record: 32088

I just finished installing a KAM on the Icom 706, using the radio's FSK terminal and "normal" FSK keying on the 706 menu. I had several good Pactor connections, but in my only RTTY QSO, the other fellow told me that my transmission was INVERTED.

So far I confirmed that my "INV" setting was off, but this affects only my receive, anyway.

I also know how to go to "reverse FSK" keying on the ICOM menu.

My question is: would pactor work if my keying was reversed? Is there any way to find out the true polarity of my on-the-air RTTY signal?

thanks

>There is nothing complex about it; it (software piracy) is illegal, immoral and unethical!

Software piracy has several variations that are being claimed:

1. Outright copying of commercial software.
I agree that is illegal, immoral and unethical.

2. Use of shareware without paying.
That can certainly be viewed as immoral and unethical, BUT
there is nothing yet supported by any case law that indicates
it is illegal. Indeed, there are good legal arguments as to why
it isn't. They have been posted here before.

Now that AEA has abandoned the Ham market, has there been any
mention of support for their products that use firmware?
Would someone in the know comment about the possibility of
the TNC source code for such products as the 232 and 900
being released? Other products?

Exactly. There are more appropriate newsgroups for discussing software piracy. There are people whose "awareness" won't be raised about the illegalities and ethics of piracy. I think they're quite aware. As long as a the government takes a lackadaisical about enforcing software copyright laws, piracy will thrive. I have yet to see them do anything to shut down the alt.warez newsgroups.

I personally use TNOS. It can be compiled for either DOS or *NIX systems and
is freely available from http://www.lantz.com . I believe that you can also
use TNOS for dial-up Internet access too.

There are various others...JNOS, WNOS etc. It really is a case of personal
preference.

Hope this helps.

> Most REALLY outstanding shareware programs make a lot of money for
> their authors.

That's the problem with the ham/radio market - it's too small to really justify putting in the work. I have written a bunch of radio related programs all for the Mac (talk about a really small market, Macintosh ham radio software!). Many of them (maybe even most) I wrote for myself, because there was nothing else available. A few of the programs I've released as demo copies, with a shareware fee required for the full version (such as a logging program with the demo allowing a limited number of entries), while the others I've released a fully functional version as shareware (such as radio control programs).

I try to make the programs functional, to the point of doing what they should, and not having bugs (or too many! ;-). In a limited market such as this, that's all thats frankly possible. As others have said, shareware for ham radio can only be done as a hobby, and a money losing one at that!

I have no doubt that shareware with a broad appeal can be very profitable (I recall hearing about the author of White Knight, the first? terminal program for the Mac. He knew he was on to something when his apartment was littered with checks... I wish I had that problem!). But this isn't (and probably never will be) the case with ham radio shareware.

Do I get all the shareware fees I should? Of course not, that's the nature of the business. I get questions from people about using my software who have never sent in the fee. The stats for my web page show many downloads of programs every week. (Obviously only a small percentage of those are probably in regular use, of course I understand that) I'm sure many other shareware authors have the same problem. Will I continue to write shareware? Of course, but I'll focus on writing software that serves my needs, and only continue to improve existing software that is supported by users.

Point your beam towards Europe and try calling CQ using Unproto mode 3
(U 3). That way only Pactor II stations will copy your CQ.

Pactor doesn't care which tone is mark and which is space. Rtty and
Amtor do. The normal audio tone frequency is "mark high". If you use
tones into a mike input on an USB transmitter the signal stays the
correct polarity. If you put the tones into a LSB tranmitter, the signal
gets inversed (a higher AF frequency results in a lower RF frequency).
For direct FSK you'll have to make the change at the TNC, the
Transmitter, or build a circuit to invert the mark/space voltage.

Granted, perhaps no shareware author has yet to take someone to court,
but most shareware licences read to the effeect that the use of the
software with out payment is *only for a set period* and that use
ofter that period is not authorized. Use beyond that point becomes a
violation of the terms of the licence, which you in effect agreed to
by using the software in the first place and thus illegal. The
arguments will undoubtedly reign until one of the shareware authors
with the resources (PKWare, McAfee, etc) hauls one or more delinquent
users into court.

Try driving a car after your temporary permit expires without buying
licence plates. That's illegal too. :)

I am in need of a IC for a Motorola Moxy 150 Mhz radio. I have contacted the Motorola service rep. in my area and I keep getting the runaround each time I speak to them. I have been trying since May of last year to get this IC and usually I hear that "I'm sorry we forgot to order it for you" or "I lost the numbers you gave me". If someone has the ability to order this for me please let me know.

It is the desc. IC with the following numbers on it "M2078" and "274 H 8436". I have tried to cross this to another number but have had no sucess.

Please do not take me wrong I am not bashing Motorola, just tried of not geting the part that I needed.

So by your argument, if you don't intend to buy a ticket for the
theatre, it's all right to sneak in by the back door? Or if you don't
intend to buy a book it's OK to borrow a copy from a library and
photocopy it?

If you use a program, then it surely has a value (however small), so why
shouldn't you pay for the intellectual copyright?

In order to hold locally uploaded messages, the reject.sys file (rejet.sys
for 5.15a) should contain a line like :

L H * * * * 0

I'm not quite sure about the exact number of *'s, but if you look in the
file it should be clear.

Sure you would. But that's not what we're talking about. A more apt
analogy would be you paint a painting to sell, and I like it so much
that I paint a copy for myself. I deprive you of intellectual property
rights, not physical property rights (which is what I would be doing
if I "stole" the physical painting that you painted.)

Who would help me ?

I'm intrested in everything about ACARS
I have found a schematic to build a ACARS interface. I can't test the interface because i don't have the program to decode them.

Who would like to send me decoder software via email ? (something like LOWE)

I'ts above my budget to buy a LOWE interface with the software, if i could test my interface i could affort it.

So to all spotters, radio amateurs... who send me software to decode ACARS (maybe there is schareware to decode them ?)

If you have any other suggestions to help me and it's about the ACAR system, be free to email them.

THANKS VERY MUCH !!!!

73
William

611. TCP/IP : NOS or JONS, beginner questioins.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-27 00:00:00 UTC
From: Kevin Gunning <brumey@ns.net>
Message-ID: <01bc0c19$148afce0$2df277cc@kg720cdt>
Source record: 32018

Hi,

I am planning to setup a mobile packet station using a Cassiopia palmtop PC
and a BayPac modem. I would like to explore the world of TCP/IP over
packet. My questions :

Whats the difference between JNOS and NOS?

What would be best for a Palmtop, (Low memory requirements)

Do I need special software for the BAYPAC BP1 or BP2?

I have the NOS book and web access so any references to appropriate
material would be great.

Thanks,

Kevin

Since AEA is at this point non-functional I need help with a setup for the pk-88. I have been using this pk-88 with my powermac for 3 years and have decided to us4e it with my pc instead.The serial cable from the pk-88 to the mac was a small round 7 or 9 pin round din plug going into the mac.Well, the only round pin connection to my trusty 486 is taken up by the mouse so I bought a modem cable that has a 25 pin connector on the 486 end and plugged it in. I have not even tried to go farther because the pacratt software is on order.Once the software is here is there anyone that can clue me in as to how to set it up?
I am running windows 95 and do not even know to what comport this little bugger is connected to.Also,since I have an internal telephone modem that is powered as soon as the computer is turned on shoiuld that generate any conflict with my IRQs when I try to operate packet?Any help would be greatly appreciated.
Yours truly:
Richard D. Vincent

If you take a picture of it without the permission of the artist, you can
be held liable for copyright infringement (filing is not necessary,
production of the original work is all that is required) in federal court.
The fine is up to 15,000 per occurrence, just ask my ex wife who "borrowed"
slides and distributed them.

As far as those giving a s*it or not, you forgot to ad "doesn't care about
asset management" to your resume. Hope any future employers don't read
your posts.

Mark

You can do it that way, RTTY too for that matter, but it also works
using FSK. The reason that PACTOR doesn't care about mark/space
inversion is that it works like packet in that it is only concerned
about state *changes*, it doesn't care *which way* the state changes.
So a change from mark to space is the same to PACTOR as a change from
space to mark. RTTY does care, however, so you have to get it right.
The problem here is that the KAM and the IC-706 have different ideas
about what is "right". Just set the IC-706 to reverse FSK and be happy.

620. BAYPAC BP2 on a Cassiopia (WindowsCE palmtop)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-27 00:00:00 UTC
From: Kevin Gunning <brumey@ns.net>
Message-ID: <01bc0c37$da10cd00$59f277cc@kg720cdt>
Source record: 32027

I was about to purchase the BP2M TNC from Baypac but there Tech Support told me that I needed a DOS system to run it. Apparently it will not run in a Windows DOS box enviroment. I would like to find out for sure.

Has anyone connected a Cassiopia (or any other WindowsCE) based machine to a BP2M TNC. Apparently the Bay[ac product is not a full TNC and cn not run from just any terminal software. It needs special software to run the TNC functions.

Anyone with advice, please reply to the group and my email.

Thanks,

Kevin

Hi all!

I ask this for one of my friends who's only got a e-mail adress but no
full Internet access. So please send reply to:
wedam.horst.cb@net4you.co.at

And please send me your congrats, got my ham license 3 days ago! ;)

Now to the problem:
We are running F6FBB 5.15c on a 386SX/16 under MS-DOS 6.22.
Now we want to add a BPQ-Node. The problem is that there don't seem
to be any docs. Can someone please explain the general sense of BPQ
in short and the integration into FBB ? Some sort of Configuration
File would help very much! So perhaps you can send your files and
explain them.

I hope someone can help us!
And remember, replys to wedam.horst..... Please do not post them here,
because I don't pass by here very often.

Tnx in advance and 73s!
Werner

I never argued the legality of piracy; certainly it's illegal.
However, in most states in the U.S., sodomy is illegal, and so is
adultery. Morality and ethics are matters of opinion. One man's
morality is another man's immorality.

>Also, you should be able to discuss your view without calling someone
>else stupid!

I was responding to HIS accusation of stupidity. Also, I said it made
him LOOK stupid, not that he WAS stupid.

627. Mobile Packet with Cassiopia and Baypak BP1 or BP2?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-27 00:00:00 UTC
From: Kevin Gunning <brumey@ns.net>
Message-ID: <01bc0bb7$79b1afe0$3df277cc@kg365xd>
Source record: 32105

Hi,

I am awaiting delivery of my new Windows CE based Cassiopia "PalmTop" PC. My intention is to run a mobile Packet station as well as other more conventional things. I will be ordering my BP1 or 2 tomorrow and have some questions :

1) Is anyone currently operating a packet station with similar equipment. If so any hints or tips?

2) Should I buy the BP1 or BP2? I am concerned about power consuption and functionallity needed. Does the BP2 draw a lot more current than the BP1? Would I benifit from the multimode features on a portable system? (I have a desktop based multimode).

3) Software? Will I need special software for the BP1/BP2? Can I just use a Terminal program? If I want to run TCP/IP over packet, what software is available that would be small enough to run on a palm top and have the ability to control the BP1/2?

4) I have a portable Multiband scanner (AR8000). Would I benifit from a BP2 Multimode with the scanner. (Fax, images, RTTY HF Stuff)

Any advice, Web site references would be gladly recieved. Please respond to my e-mail address as well as newsgroup.

Many Thanks,

Kevin

> Can someone tell me frequncies for a good Pactor II mailbox...
>
> I would also be interested in other setup info...
> LSB/USB, Tones setting in your PTC-II etc...

Art:
look for Mailboxes between 14070 and 14080 kHz.
Call cq using the U2 mode (this can be copied by all stations, maybe some P 2 stations will hear you)
Use either LSB or USB on SSB.
Use the automatic tones (default).
Switch off any compressor you might have and reduce mike level so that you get approx 75% of nominal power.
To set the level use the FSKA and the PSKA commands on the PTC 2.
Set the bandwidth of your receiver to something above 500 Hz.
Do not use any direct FSK setup for Pactor 2.

Look in some mailbox (maybe on packet on vhf) for a list of Mailboxes.
There are some lists which are regularly updated.
If you hear a box on SW tune your receiver carefully so that the middle LED lights and the two outer LEDS turn green.
Switch off AVC on your receiver.

Hope this helps and good luck with the PTC 2.

You know, it's fairly well known that as well as pirate software, all hams are fat. THEREFORE, I resolve to raise awareness to this issue!

Please diet! It's immoral, unlawful, and unethical to be so large! What you're doing is wrong! Your health care costs are sucking up money from all of us law-abiding skinny people, and it needs to stop.

Every day, men and women pump money into health spas and treadmills so as to increase the length of their life and lower health care costs. Yet, all of these fat hams keep eating their ice cream and fudge and drive up health care costs.

Thankyou, and I hope that you all realize the harm that you are causing!

Hello,

I am serious thinking about trying RTTY. Until now I don't have any
experience with this mode. Mainly I am interested in DX on the HF bands
and use a IC-736, a 500W linear, beams: 20/15/10m, 30/17/12m and a
Pentium 90 PC. I am interested to run RTTY for DX and a few Contests,
if possible.

I would like to use some good hard- and software; it must not be the
cheapest solution. :->)

Here are my questions to the gurus:

1. Which hardware and software you would recommend for RTTY?
2. Do you know any online document, like a FAQ, which I should read?
3. Do you have any further advices, hints, etc. for me?

Many thanks for your help in advance ..

>only appears to be associated with a cold TNC.

More likely the problem is a cold radio. Yaesu radios using the leaky
PTT keying method want to see about 2.2 k to ground. Icom rigs using
leaky PTT want to see about 10 k to ground. If I'm not mistaken, the
MFJ jumpers in a 4.7 k resistor when set to key a HT. That always works
on an Icom, though it loads down the audio a bit, but it doesn't always
work on a Yaesu. Change the resistor to 2.2 k (tacking another 4.7 k
resistor across the one in the TNC ought to work).

We are pleased to announce that our new application note,
'Device Control via the PC' is finally available.

This application note covers such topics as PC control of lamps and motors
using solid state and mechanical relays, device control using both
BJT and power MOSFET transistors, stepper motor control using a transistor
array IC, as well as PWM motor control using the L293 H-Bridge. Connection
to the PC is made via our inexpensive EDE300 PC Interface IC. Code examples
are also provided.

Feel free to download a copy today; it is available at
http://www.netins.net/showcase/elab in the 'Integrated Circuits' section
under 'EDE300'.

650. Digital Wireless Voice

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-29 00:00:00 UTC
From: John Meloche <jmeloche@cyberus.ca>
Message-ID: <01bc0da1$f6168ce0$09b186cf@algnet.algonquinc.on.ca>
Source record: 31956

I am an electronics technology student at Algonquin College in Ottawa, Canada. Presently, I am involved in a group that is developing a two way Digital Wireless Voice communication system.

This product will be powered by standard 120VAC. It is to be low power (operate within an office or a small building), message storing/retreval, and a couple of other features.

So far in the very preliminary stages, here is the basic idea:

microphone i/p; LPF; PCM encoding; FSK modulation; antenna o/p

antenna i/p; amplifier; FSK demod; PCM decoding; memory; LPF; speaker o/p

My question:

I would like to hear your opinion / ideas on this subject. Your input is greatly appreciated. (info on digital wireless voice seems to be scarce on the web.)

651. U-NII new unlicensed spectrum

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-01-29 00:00:00 UTC
From: tedwards@access1.digex.net
Message-ID: <5cmp2i$mh8@access1.digex.net>
Source record: 31957

I'm totally suprised there hasn't been more talk about the new U-NII bands
in this forum!

The FCC has granted the following bands for use in the "Unlicensed
National Information Infrastructure" service:

Band 5.15-5.25 GHz 5.25-5.35 GHz 5.725-5.825 GHz

Use indoor lans campus-wide community nets

Max Power 50mW 250mW 1W

Max EIRP 200 mW EIRP 1W EIRP 4W EIRP
(i.e. 6 dBi antenna)

Shared with MSS Feeder Government Government
Links radiolocation radiolocation,
Amateur, ISM,
and other Part 15

Peak Power Spectral 2.5 mW/MHz 12.5 mW/MHz 50 mW/MHz
Density (for <20 MHz
emission bandwidth
only)

Transmit Antenna integral part permanently permanently
of device attached attached
antenna antenna

Out-of-band power 10MHz out 10MHz out 10 MHz out
27 dB down, 34 dB 40 dB
37 dB elsewhere 44 dB elsewhere 50 dB elsewhere

Clearly, these are not going to be "build-it-yourself" style equipment,
but "appliances" as they say. But the U-NII is being pushed big by Apple,
so who knows, the U.S. may become a far more wired place soon.

I have the 13 pin plug with no wires attached. There are terrible to
solder to as the plug is made of straight pins. You would tack the wire to
the side of the pin. The plug has no solder pots for accepting the wire
and solder. You are better off using the 13 pin plug with the 6 inch pig
tail attached that comes with the 706 for building such a cable.

I haven't seen any to date and it stands out like a sore thumb. One possibility and it has been done is to use the dos stuff via dosemu. I have to get around to it some time soon. That's the beauty of linux, you can run all the dos and windows stuff (under Wabi and wine looking much better) all without a dos partition anywhere in sight......G3VBV.

Hello there. I am Jim Haas, KG9IF, QSL/Contest/Awards Manager for the Husky Amateur Radio Club, W8YY, which is the amateur radio club of Michigan Technological University in Houghton, MI. Every year over a festival known up here as Winter Carnival, where everyone takes a couple of days off to enjoy the snow (we get a lot of that up here), we run a special event station. This year's station runs from 1100Z on 30 January 1997 (6:00 AM Eastern) to 1100Z on 1 February 1997.

"So Jim," you ask, "what do I get for working this station?" Well, if you work our station, just send us a self-addressed, stamped envelope suitable for holding a certificate and we will send you just that--a really nice certificate that says you worked W8YY over Winter Carnival.

Below is the frequency list, which is a general guideline and not a promise of where we will be. I can guarantee one thing--if you look around, we will be there. We may not be on, for example, 14.325 exactly, but we'll be on 20 somewhere. We may also do some HF digital modes (we still need a few connectors for that) and some satellite work as well. If there is enough interest among the station ops/control ops, we will work some CW as well.

If you have any questions, comments, or criticisms, just drop me a line at jdhaas@mtu.edu. We look forward to hearing you on the air.

73 de Jim Haas KG9IF

Band Mode Frequency
17 M USB 18.130.0 MHz

20 M USB 14.325.0 MHz
CW (maybe, if
there is 14.130.0 MHz
interest)

30 M CW (if there 10.125.0 MHz
is interest)

40 M LSB 7.262.5 MHz

75/ LSB 3.972.0 MHz
80 M

160 M LSB 1.932.0 MHz

Popular suggestions are the KAM and the PK-232 multimode units.
They aren't bad, but neither performs any better for pure RTTY
than an old Hoff TU fitted with an adaptive slicer. You can build
one of those in a few hours for less than $50 USD (much less if you
have a fairly well stocked junk box). That'll give you about the
best non-DSP performance you'll find.

DSP can be helpful in receiving RTTY buried in noise. The HAL
units, and the SCS PTC II, do a respectable job of digging weak
RTTY out of the noise, though the latter is certainly the high
price solution to RTTY operation. You can do about as well using
Beezley's RiTTY program and the SoundBlaster card in your PC.
That's a good low desktop clutter approach which doesn't sacrifice
RTTY performance in order to achieve reasonably low cost. I believe
he's asking about $100 US for the program. Of course the other
products support more advanced modes than just RTTY, but there
is little contesting activity yet with the advanced modes.

Source record: 31963

I have my eye on a PK-900 and I was wondering if there is any public domain or shareware program that can be used to send and receive SSTV and WeFax using the PK-900. I just want to play around with it a little when I get the PK-900.

Thanks,
Kory

As Mr. Beddinggfield is correct, this is rather off topic for the news group I should apoligize for continuing the thread.

My apology is, however to the list as a whole, not simply Mr Beddington, as there is no call for this type of knee jerk, profane response to what was, after all a polite discussion.

Perhaps another thread regarding the legal use of profanity and obscenity would be more appropriate?

This is to request recommendations for a state-of-the-art portable packet system. Cost no object. But portability is critical. So is 9600+ baud.

I see no imminent offering of a digital-ready HT that could support 9600+ baud. But perhaps someone has a reliable mod that works. I would be willing to compensate someone for his time to put together something that would work as a walking node in an AMPRnet.

You can't possibly be serious. You must be:
1) College student who already knows everything
2) A liberal, who actually knows absolutely nothing
3) A sick idea of a bad joke.
4) Never bothered looking up "Leptin" with a web crawler to find out many
obese folks are that way because of a natural leptin deficiency.

But then again, you obviously aren't smart enough to realize that
discrimination against obesity is as bad or worse than racial, sexual or
any other discrimination. Your claim of obesity being immoral, illegal
and unethical clearly illustrates your predilection for irrelevancy.

Get a life, loser!

More likely the problem is a cold radio. Yaesu radios using the leaky
PTT keying method want to see about 2.2 k to ground. Icom rigs using
leaky PTT want to see about 10 k to ground. If I'm not mistaken, the
MFJ jumpers in a 4.7 k resistor when set to key a HT. That always works
on an Icom, though it loads down the audio a bit, but it doesn't always
work on a Yaesu. Change the resistor to 2.2 k (tacking another 4.7 k
resistor across the one in the TNC ought to work).

>
> I would also be interested in other setup info...
> LSB/USB, Tones setting in your PTC-II etc...
Art:
look for Mailboxes between 14070 and 14080 kHz.
Call cq using the U2 mode (this can be copied by all stations, maybe
some P 2 stations will hear you)
Use either LSB or USB on SSB.
Use the automatic tones (default).
Switch off any compressor you might have and reduce mike level so that
you get approx 75% of nominal power.
To set the level use the FSKA and the PSKA commands on the PTC 2.
Set the bandwidth of your receiver to something above 500 Hz.
Do not use any direct FSK setup for Pactor 2.

Look in some mailbox (maybe on packet on vhf) for a list of Mailboxes.
There are some lists which are regularly updated.
If you hear a box on SW tune your receiver carefully so that the middle
LED lights and the two outer LEDS turn green.
Switch off AVC on your receiver.

Hope this helps and good luck with the PTC 2.

From: wkebsch@news.sni.de (Kebsch)
Subject: RTTY: How start with it (equipment, etc.)?

Hello,

I am serious thinking about trying RTTY. Until now I don't have any
experience with this mode. Mainly I am interested in DX on the HF bands

and use a IC-736, a 500W linear, beams: 20/15/10m, 30/17/12m and a
Pentium 90 PC. I am interested to run RTTY for DX and a few Contests,
if possible.

I would like to use some good hard- and software; it must not be the
cheapest solution. :->)

Here are my questions to the gurus:

1. Which hardware and software you would recommend for RTTY?
2. Do you know any online document, like a FAQ, which I should read?
3. Do you have any further advices, hints, etc. for me?

Many thanks for your help in advance ..

THANK..
I'ld be very pleased to know if the STANDARD C500 (or HEATH HW24HT for
U.S.A. ...it's the same radio) is a good radio to go to 9600bds and in
the positive case I'ld be happy to receive the modify for it.
Any advise ???
Nino

hi, folks.
i 'm looking for diagram of wiring connection from tasco tmb-965
9600modem
to radio.
i just got used tasco 9600 modem and tnc-2 clone.
i didn;t get any manual or diagram. I'm gonna set up this modem into
TS-790A. However, i dpn't have any idea how i connect from 9600 modem to
radio.
Thanks in any advance.

I have the following items for sale:

Yaesu FT-990DC HF rig with optional 500 Hz CW and 2.0 KHz SSB filters.
Also
have the matching SP-6 Deluxe speaker with optional LL-5 phone patch built
in. Entire system is less than a year old, little use and in mint
condition.
Asking 1700 OBO for both. Might consider splitting. If interested, drop
me a note or call me at (805) 949-1244 or (805) 949 9833. if busy.

> With the arrival of the internet, packet take a real bad hit. I just hope
> it won't stay that way, otherwise I will have a lots of equipment for sale.

The whole argument of Packet vs Internet strikes me as nonsense.

Each has its uses, strengths and weaknesses. Seems to me that if
the internet is making your packet equipment useless, then maybe
you were wasting the packet equipment in the first place.

For example, we use packet radio to pass runner safety information
from over a dozen checkpoints along a foot race course that spans
100 miles of mountain trails. We track the status of the runners
as they pass each checkpoint, so that none can be lost or injured
without rescuers being sent promptly for them.

The internet doesn't have much use there. For that matter, even
cell-phones don't work. The job used to be done completely by
amateur voice communication. Packet radio has streamlined the
process.

Just my 2 cents, as they like to say....

The 1997 Dayton Hamfest will once again have a digital gathering. The place remains the same as in past years. The name of the hotel has changed from the Raddison to the quality Inn.

There will be a RTTY DX & Contesters dinner on Friday night and the big Digital Dinner on Saturday as usual. The hospitality suite will be open with all of the familar faces of the last 20 plus years.

There is NO sponser of anything going on other than those individuals that have picked up the vacuum of the Digital Journal (formerly RTTY Journal) and gone ahead with normal activiites.

Rooms are available but need to be reserved. Notes to Ron Stailey, K5DJ, on the Friday Dinner and on the Rooms. Rooms are limited so don't wait. Plaques for the CQWW RTTY contest, the WW RTTY WPX contest and several programs are already planned. Ron is at k5dj@easy.com for info.

I will be handling the Saturday Banquet Buffet dinner and program tickets which are obtainable only in advance. We hope to have a major guest speaker on Saturday night and are expecting the usual crowd to attend. For more info on these drop me an email at: ws7i@iea.com

There are probably two if not more digital forumns taking place at the Arena. Pactor and Digital I believe.

Hi
I have no idea about Linux but I run ax25, tcpip, netrom all on the
same port, however only on one port, no reason it will not run on more
than one..
My system has 8 ports but I mainly keep the ip on one freq and ax25 and
netrom on oter freq's but one port does them all..ok..

Firstly I hope the placing of this advert does not infringe any agreement
that I don't know about. If so I apologize in advance.

I have the following radio equipment for sale:

1 LOWE HF-150 digital communications receiver, includes keypad, nicads,
psu, whip and manual. As new.

2 YAESU FRT-7700 Antenna Tuning Unit. Excellent condition.

3 DATONG AD270 Active Antenna.

I would like approximately 250 UK pounds for the lot, or I would be
prepared to split it up and sell items individually.

Please contact me by email rather than through the newsgroups.

I use Nos with Win95 and PCELM for my mail program which is DOS based.
Is there a Windows Mail Program about with cut/paste and attachment
facilitys that might be able to be used with Packet.

Some time ago I used OS/2 and there was a program PMNOS which had an
associated mail program PMMail, both worked well and handled TCP/IP,
does anyone know if this was ever ported to run under Win95 or NT or
if there is a similar program which handles TCP/IP (Windows Based -
NOT DOS).

Any ideas / suggestions gratefully appreciated.

You sure can, all sorts of stuff is successfully used, we have a large
number of Linux TCP/IP users in Central England, many use kernel AX25
and netrom as well, also AX25 users digipeat via me or connect and join
our convers channel.

Timewave's DSP-599zx and DSP-59Y both have DSP based RTTY modems as a standard feature. You need a dumb terminal such as Comp RTTY to run them. Performance will be much better than standard Analog Modems due primarily to optimized filters. Check out our web site at www.timewave.com.

>>

The Cassiopia will not run DOS based programs.
Therefore any current amatuer radio software made for PC's (that is DOS based)
will not work with the unit.
However, you might be able to utilize a TNC such as a KPC-3 or a Baycom modem
(BP-1 /BP-2/ multimode)
through say a communications program.
(Rough, but it will work)

The best deal is for you to forget the Cassiopia and get a HP100 / 200LX
palmtop from HP.
A much better palmtop for the amateur radio operator *IMHO*.

Then a simple set up like Phillip or I have is easy to accomplish.

see: http://www.gatecom.com/~maccabeus
or http://www.umecut.maine.edu/~baack/bay.htm
for examples.

As far as a PCMCIA tnc, I have yet to see any... but I am keeping my eyes
peeled.....

Hi!

I have heard that AEA's PK96 should run at 19.2kbps with
minor modifications, so, does anybody know how it's done.
And how wide filters it needs? I have on my G3RUH modified
FT736R with 15KHz filters.

Hello,

Does anyone know where I can purchase a Rockwell/Collins or a Motorola
GPS receiver board (not enclosed) like the ones TAPR are selling.
I would like to send one up on my next high altitude balloon flight and
I understand these units do not have the altitude restriction most other
units have.
Thanks, Doug

Try turning the FSKINV parameter on your KAM "on". This would allow
your mark and space for RTTY to be correct when hooked through the Molex
connector in the back of your Icom. I have to do this with my IC-751A.

If I leave FSKINV "off" (it's default) then I have to work RTTY while in
LSB. Why lose all that nice RTTY tight filtering? This worked for
me...I hope it's the same for the IC-706.

>radio. It looks like I need to re-net the receiver crystal.

The receiver netting adjustment for the KS-900 is TC-1. If you have
the board oriented so that the chip is top center, Rx crystal X1
and trimmer TC-1 will be at the lower right corner of the board.
(The crystal next to the chip is the second conversion oscillator,
leave it alone.)

The Tx netting adjustment is TC-2. The Tx crystal X2 is near the
center of the board, the trimmer is nearby. Don't go poking around
with any of the transformers without a spectrum analyzer. Otherwise,
spurs will be the inevitable result. The multipliers and PA of this
radio *must* be tuned for minimum spurs, not maximum output. The
two points are *not* the same. You can make small frequency netting
adjustments safely, but if you install a different crystal and need
to repeak the transmitter, *use a spectrum analyzer*.

Jim, if it has a serial port, it can be wired to a TNC. Unless you want
to implement hardware flow control, only three wires are needed, TxD, RxD,
and signal ground. *Any* terminal emulation software for the machine will
work for packet. There were a number of them written for the Apple II.
There's bound to still be an archive site for old PD Apple II software
somewhere on the net.

That's not strictly true - some terminal programs for the Apple II
family perform poorly (read: lose characters) above 1200 baud. This is
because the Apple II hardware doesn't support serial port interrupts -
all serial I/O has to be polled. When the screen scrolls (which has to
be done completely by the 1 MHz 6502 CPU) it is possible to miss
incoming characters since the ROM routines to scroll the screen don't
check the serial port.
Still, all is not hopeless. Some programs use their own scrolling
routines which periodically poll the serial port and collect
characters. I wrote routines to do this back in my Apple II days, and
even routines written in C would allow 9600 baud using an Apple Super
Serial card.
My advice however, is to retire the Apple II (I donated my Apple
//e to my son's elementary school where they still use them) and get
an old PC XT compatible. I see them all the time for $20 including a
monochrome monitor. You'll have a much wider selection of software.

I would just point out that it was traditional to use LSB for RTTY and
other digital modes. Your method works, and unless you tell the
traditionalists, we'll never know. Whatever works and gives you the
ability to hear and be heard. Incidentally, I don't think the 706 has
tight rtty filtering. 73 de n8blk/3 -art clemons-

These plugs are readily available here in the U.K. as 13-pin DIN
plugs, and I believe they are used on Atari ST computers as the
computer video ports.

One soldering tip I heard was to pull out the pins you don't need
before soldering to the one you do.

Hello folks,
I am looking for information about the hooks into
L2, the TSR distributed for Baycom. I am hoping to
write an application that acts as a snooper, grabbing
dx spots without being connected.

Has anyone out there sucessfully programmed an
application for L2?

I have also tried with the AX25 program written by
Pawel Jalocha, without any sucess. I can set up
the interrupts to call back and forth, getting the
backcall address ok, but I have not been able to
return ds:offset location to grab a buffer of data.

Has anyone sucessfully written an interface to AX25?

Again, my goal is to snoop the dx traffic intelligently
(more intelligently than what SCC does), so any other
suggestions would be appreciated.

Please reply both to the news group, and my home
email, as I don't always get the latest.

Thanks!
dave /nt1u siegrist@rock.enet.dec.com

Hi Bob,

I can only comment on packet stuff....

I'm have been running my packet BBS and internet gateway for some time
now on FreeBSD. I'm hoping to make it available as a port soon.

There is a version of TNOS and a version of WAMPES that will compile
on FreeBSD.

For other types of applications, take a look at the
ftp site "ftp.ucsd.edu/hamradio" .

I run FreeBSD here on packet. TNOS 2.20 almost compiles perfectly.
Expect when TNOS 2.21 is released it will compile perfectly. Currenlty
the biggest snafu with FreeBSD and TNOS is that FreeBSD's slattach
doesn't like connecting to a pty. I'm working on it.

There are many amateur radio operators running FreeBSD, but they are
not as vocal as the Linux users.

Of course it can. I used an Apple //e on packet for many years. All
you need is a serial card and a terminal program.

>
> Thanks, Darryl

I looked for 9600, and the only activity listed seems to be on a board in the mountain view area. Though I sent the sysop there email and didn't get a reply last time I checked. I asked the guy who runs the local BBS in Berkeley, and he said that they didn't want to go for the equipment for 9600 since they didn't figure there'd be many users. He also said that 9600 is a bit of a challenge in the SF area since the hills make for multi-path problems.

Hi All
I had been following the previous discussion on using a dsp card for demodulation of signals. A reciever front end was used with two mixers to give a I and Q output which were feed into the codec on the dsp card allowing one to do a transform and demodulate ssb. My queston are:

1. How are the mixers set up ?
2. When the I / Q are feed into the codec, what transforms and sampling rates are needed.

I have a ezkit lite dsp board, which works pretty good I thought somebody out there would be ableto help

Thanks Michael

It does if you install the optional 500 Hz filter.

Hi,

I'm looking for the following antenna parts. If possible I would like to
be able to get them in Jerusalem, if not I would like to find a source
in Israel.

silver plated pl259's
rg/58 adaptors for above
rg/8x or 8, adaptors for above.

rg8x or 8n coax
75 ohm coax (not tv coax)

4:1 or 6:1 baluns that can handle at least 100 watts continuous power.
Ferrite toroids, if you can't buy 'em (baluns) make 'em.
#14 or #12 enameled solid copper wire.

300 ohm twinlead
450 ohn ladder line.

non inductive resistors, I need 450 to 600 ohms 100 watt. Though I could
get away with about 25 watts total,or 270 ohms 2 watts or 5 watts
(24 of them).

Thanks and 73, Geoff.

Sins a long time i'm looking for a working sollution to receive and
decode the ACARS.

I have 2 different schematics and 2 different software packages. The
software is from AEA and the other from LOWE.

Some people says that the AEA software is working fine with a hamcom,
when i start the program, i see the data-indicator going on and off buth
the screen stay's empty. (ill try'd with squelch and volume settings
buth nothing works)

The LOWE needs a hardware key.

I'm thinking of bying a complete system with software and interface buth
is it going to work with my TH-79 from Kenwood (should i look for the
problem in the receiving of my Kenwood ?)
Still the litle interface from LOWE is to expencive.

MY QUESTION IS :

Are there any people out there who are working with homebrew interfaces
and what kind of software do they use with it ?
Are they welling to share the schematics and software ?
Sins there are not much people who are intrested in the ACARS system i
don't think to get lots of mail.

A SECOND HAND INTERFACE WITH SOFTWARE IS ALSO WELCOME !!

Thanks to all and ill hope my loking is going to end now :-))

From: Costas Spanos <spanos@eecs.berkeley.edu>
Message-ID: <32F4D69C.41C67EA6@eecs.berkeley.edu>
Source record: 31928

In my quest to acquire a decent RTTY/TOR filter for my ICOM 706,
I realized that I really do not know the bandwith needed by the various
TOR protocols. I realize that the frequency shift is only 170Hz, but the
rapidly switching tones surely generate significant sidelobes. So, what
is the useful bandwith for RTTY, AMTOR, PACTOR, GTOR, PACTOR II etc?

(I have ordered the 350Hz CW/RTTY filter for the IC706, but I am now
wondering whether it is too narrow for the faster TOR modes).

Costas

KE6SYN

P.S. Thanks to all who responded to my previous question on the inverted
Mark/Space tones. What I have learnt: RTTY and Amtor care about
polarity, Pactor does not. FSK tones go out in LSB. The KAM and the ICOM
706 have different ideas about polarity, so I now use the "reverse"
setting on my 706 and get correct polarity on the air.

Hello... Brian here!

If you have a RADIO and a SOUND BLASTER (or compatible card) you already have all the hardware necessary to receive WEFAX, FAX, SSTV and RTTY.

You can also transmit monochrome FAX and SSTV, with the current version of my FTV software.

*** Put the power of your 80386, 80486 or Pentium processor to real use ***

The external "decoder" units that are used by conventional users are modelled inside this software. This makes it easy to get started, inexpensive and rids you of the inevitable tangle of wires and boxes of decoders.

Absolutely no external hardware, other than a simple audio lead, is required by FTV. The current version decodes:

WEFAX (from weather satellites, e.g. 137-138 MHz)
HF-FAX (from terrestrial stations)
SSTV (from radio amateurs, e.g. 14.230 MHz)
Baudot (press, naval, weather etc)

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) The incoming signal is analysed automatically - standard modes, line rates, baud rates and keying polarity are automatically determined following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

*** What are you waiting for? Try it now! ***

Take a look at my web site for futher details, from where you can download an evaluation copy, at: http://www.geocities.com/SiliconValley/2504

A registered copy costs US$ 25. Registration promotes the further development of this software and entitles the user to future upgrades

paying only for delivery
expenses, if any.

Fianlly, just in case some of you have trouble accessing my web site, here is my postal address (if you want a reply, send a self-addressed label and IRC's to cover expenses):
Brian E. Cauchi,
Gawhra, Domenico Cachia Street, Birkirkara BKR06, MALTA.

What can I say? Try it, and may you have as much fun as I am having...
73's from Brian.

> Radio Amateur ONL4021
> QSL via bureau UBA Belgium Hi Bill; you didn't say on what op system or PC you are
running this,
but there are several possibilites;

a. For most Windows users, you MUST run the ACARS software in a DOS mode. This does not mean a DOS box (as you can in Win95) but completly outside Windows. The reason for this is that ACARS and Windows conflict because each wants to control the serial port connection exclusivly. So you must exit Windows (yes, even '95) completly to run ACARS.
b. Leave your squelch completly open. The reason for this is because most squelches don't react fast enough, and part of the message will be lost before the audio reaches the interface.
If you are interested in getting more info on ACARS, come join us on majordomo@grove.net . Send a message like the following with nothing else in the body of the message;

subscribe acars
We also have a digest service (acars-digest) if you are interested in that. To my knowledge there has been no shareware development of ACARS software, but who knows that may change one day...73s Mike (colistowner, ACARS)

> Thanks Michael

Ok, I've been working with that combo, Michael. The radio design is loosely based on Rick Campbell's R2 receiver design (see Campbell's articles in QST or the new Handbook). I use a pair of SBL-1 balanced mixers since I had several on hand. They are fed in phase quadrature by a LO. I've used my IFR500 as the LO in early work, and now have a VXO circuit I'm using. I've been using a lumped LC 90 degree phasing network to get the quadrature signal. (You have to peak this for best quadrature, even a small error causes a large loss of opposite sideband rejection. A better way to get LO quadrature is needed for a practical unit.)

I use a preselector/preamp/attenuator front end based on a pair of loose coupled tunable LC tanks and a MAR-4 MMIC as preamp. (This could use some more work.)

The AUX input has 45.5 db of fixed gain and the ADC programable gain block has another 21 db of gain. The converter itself has 70 db of dynamic range. So the MDS of the EZlite is about -136 db referenced to 1 VRMS across 15 kohms. The mixers have about 6 db of conversion loss, and the MAR-4 has about 17 db of gain. So the overall system gain is about 147 db.

I terminate the mixers with 50 ohm resistors (they need a broadband termination), and bridge across the resistor with the 15 k input impedance of the codec. That gives a receiver MDS of -123.5 dbm. That's not as good as I'd like. You could use discrete FETs between the terminations and the codec to boost the signal, or use a diplexer termination and matching network, but I just slap another MAR-4 in

the front end for weak signals (and an attenuator for strong ones). That's a poor gain distribution, but it works Ok for my tests. I'm not using the programable gain function of the codec at all. I just set it for max gain.

I am using 8 kilosamples for most of my experiments, but I'm doing low rate data experiments. You'd probably want a higher sample rate for speech. (I also need to pay more attention to anti-aliasing filtering. You might want to look at this.)

To do SSB demodulation, just do a Hilbert transform in one channel (a dummy delay in the other), sum the two channels, normalize, and LP filter the output. You can select USB or LSB depending on which channel has the Hilbert transform routine. (The Hilbert transform is essentially an all-pass filter which gives a broadband 90 degree phase shift.) There is example code in the Analog Devices application books that you can ripoff for most of this.

I'm not much of a DSP programmer yet, and I've taken no pains to optimize the RF hardware (as I'm sure several of you have noted), so I'm sure large improvements can be made over what I'm doing. This has been more of a proof of concept effort for me than anything else.

I've also reversed the scheme to make a I/Q transmitter. If you feed I and Q to the mixers from the EZkit (or a Soundblaster, which is what I'm using for this) and turn the MAR-4 around to act as a PA, you've got an arbitrary modulation transmitter. I generate WAV files which I play through the sound card to generate various modulation forms. This makes a handy test generator, and can even be used as a low power transmitter.

At this point I intend to abandon the EZkit and just use the PC sound card for future experiments. That way I can code on the PC in C where I'm more comfortable. For the low data rates I'm working with, there should be enough horsepower to make it work (I'm using a Pentium 120). If not, I guess I'll have to buckle down and *really* learn assembly programming on the AD chipset.

Gary

Can't help you with L2 but I did do a version of AX25 for use with
BPQCODE. BPQ doesn't support the "upcall" or "backcall" method of
transferring a packet to the application software as per the "FTP packet
driver specification" so the whole complicated (IMHO) mess of the
double-upcall routines is avoided.

BPQ polls the driver at each timer tick (more or less) and the driver
responds with a "yes, there is a packet for you at DS:SI of length CX"
or CX=0 if there is no packet ready. The AX25 code was modified
accordingly and it works well with BPQ. I guess I'd suggest using that

method rather than the upcall method with AX25, as it's less complicated. Also, there's a lot of excess baggage in AX25 that is required for a NOS packet driver but not useful for your application, which can be removed.

What language are you working with? I have a little bit of info about the assembly language interface to QuickBASIC around here somewhere and from what I remember of it, I think it would be really difficult to get it to work with AX25. C or Pascal ought to be easier. The best choice would be 80x86 assembler, incorporating what you need of AX25.ASM directly into your code.

If you want to use a higher-level language, definitely look at using the method that BPQ uses. It's described in the BPQ EXTERNAL.DOC file. If you do it that way, you can just load BPQAX25.EXE (or my version of the driver, BPQBAX25.COM) as a TSR amd let your application program work with it as if it were BPQ.

One caution - BPQ is also a TSR that is normally loaded immediately after the driver, so there is no chance that the driver's rx buffer will overflow before BPQ starts polling for and taking received packets. If your application isn't used this way, it may get a few meaningless packet frames (that filled the receive buffer before it was loaded) when it initializes.

Good luck with your project, and let me know if you want me to send you any of the files mentioned above - 73

This is great.. I have never gotten into the Linux rush.. Have 8
machines running FreeBSD here.. Would love to get some Ham Radio stuff
running on them..

Let me know when your done..

>only appears to be associated with a cold TNC.

More likely the problem is a cold radio. Yaesu radios using the leaky
PTT keying method want to see about 2.2 k to ground. Icom rigs using
leaky PTT want to see about 10 k to ground. If I'm not mistaken, the
MFJ jumpers in a 4.7 k resistor when set to key a HT. That always works
on an Icom, though it loads down the audio a bit, but it doesn't always
work on a Yaesu. Change the resistor to 2.2 k (tacking another 4.7 k
resistor across the one in the TNC ought to work).

Art:
look for Mailboxes between 14070 and 14080 kHz.
Call cq using the U2 mode (this can be copied by all stations, maybe
some P 2 stations will hear you)
Use either LSB or USB on SSB.
Use the automatic tones (default).
Switch off any compressor you might have and reduce mike level so that
you get approx 75% of nominal power.
To set the level use the FSKA and the PSKA commands on the PTC 2.
Set the bandwidth of your receiver to something above 500 Hz.
Do not use any direct FSK setup for Pactor 2.

Look in some mailbox (maybe on packet on vhf) for a list of Mailboxes.
There are some lists which are regularly updated.
If you hear a box on SW tune your receiver carefully so that the middle
LED lights and the two outer LEDS turn green.
Switch off AVC on your receiver.

Hope this helps and good luck with the PTC 2.

From: wkebsch@news.sni.de (Kebsch)
Subject: RTTY: How start with it (equipment, etc.)?

Hello,

I am serious thinking about trying RTTY. Until now I don't have any
experience with this mode. Mainly I am interested in DX on the HF bands

and use a IC-736, a 500W linear, beams: 20/15/10m, 30/17/12m and a
Pentium 90 PC. I am interested to run RTTY for DX and a few Contests,
if possible.

I would like to use some good hard- and software; it must not be the
cheapest solution. :->)

Here are my questions to the gurus:

1. Which hardware and software you would recommend for RTTY?
2. Do you know any online document, like a FAQ, which I should read?
3. Do you have any further advices, hints, etc. for me?

Many thanks for your help in advance ..

Hello:

I have the following items that I no longer need and are gathering
dust around the house:

1) Borland Turbo C++ For DOS v 3.0: This is a complete install on BOTH
3.5" and 5.25" HD disks
and comes with the full documentation (a VERY big book!).
While this will NOT compile
NOS without some major changes to the source code, it can
compile many other programs
and be used by someone who wants to learn C or C++
programming. Has a very nice DOS
developer's environment.

Sells new for $90.00

Your price: $45.00 obo

2) Borland C++ For Windows, DOS, and Win32 v 4.50: This is a complete
install on CD-ROM. All
documentation is on the CD-ROM. This WILL compile all NOS
variants!! Comes with full
debugging and optimizing functions. Also supports ANSI C. May
be only partially
installed to the hard drive to save space if needed. This is a
VERY nice package and
is intended for professional programmers.

Sells new for $300.00

Your price: $65.00 obo

3) Borland C++ For Windows, DOS, and Win32 v 4.51: This is a complete
install on 28 (!) 3.5"
HD disks. Fixes a very minor bug in v 4.50 (I never saw it
come up!). Must be FULLY
installed to the hard drive (needs almost 100 megs). Is
otherwise identical to #2
above.

Sells new for $300.00

Your Price: $65.00 obo

4) Info Magic Linux CD Set: This a VERY complete Linux package and
includes full installs for:

Red Hat 3.0.3, Slackware 3.1, Debian 1.1.4 and more. Has
XFree86, full HOWTO set, and
much, much more. This is a >6< CD-ROM set! Not that the CD
case itself is damaged, but
the CDs themselves are just fine. There are many Ham packages
(mostly packet) that run
under Linux with many more being added all the time.

Sells new for $50.00

Your Price: $35.00 obo

```
*****************************************
* SPECIAL ONE FOR ALL DEAL: *
*---------------------------------------*
* Take all 4 items for only $175.00 USD!!! *
*****************************************
```

```
**********************************
* TRADERS TAKE NOTE *
**********************************
```

Those Hams wishing to trade, I am looking for the following Ham gear
(must be in good working order and complete.):

1) Any 6m FM or SSB xcvr. Tube or solid state OK.
2) Any 2m FM or SSB xcvr. Tube or solid state OK.
3) Just about any packet gear... TNCs, radios, what-ever. I am
especially looking for an SCC
type card.
4) Any 2m hand held with good battery.
5) Let me know what you have! Please note that I have no interest in
HF gear.

```
**********************
* SPECIAL NOTES *
**********************
```

1) Due to export restrictions, the above may be sold only to US
citizens and shipped only to US
addresses.
2) All prices include shipping by my choice of carriers.
3) I prefer to sell as a package and package offers will take
precidence.
4) I prefer to trade the items and trade offers will take precidece.

If interested in any of the above items, please contact me via packet
or E-Mail at the addresses below. Please include your name, packet
and/or E-Mail adresses, phone number(s) and hours I can contact you.

Thanks!

Take Care & 73

Hello!

I'm trying to modify my Alinco DR410E for 9600 bps packet.
Has anyone done it allready ? Does anyone own any schematics
and pcb layout etc. documents for this rig ? Or where I can
find one ?

I have heard this is same rig as DR 110, but I'm not sure.

741. Re: http & jnos help!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-03 00:00:00 UTC
From: Nidge Jones <nidge@nikel.demon.co.uk>
Message-ID: <gyYW6CA1ae9yEw$D@nikel.demon.co.uk>
Source record: 31943
Cross-posted to: uk.radio.amateur,rec.radio.amateur.digital.misc

In article <32F1D046.7F18@aber.ac.uk>, SIMON RICHARD JUDE
<srj5@aber.ac.uk> writes

>Hi,
>I am wondering if anyone can help me as regards to getting JNOS to
>receive http files? I know it can be done, but I could do with some help
>finding the software that will enable me to do this on my elderly 386. I
>have the JNOS but require the browser & another piece of software who's
>name I've forgotten which enables the browser to communicate with JNOS.

Junk that pre-historic Jnos and run Brian Lantz's (ko4ks) TNOS instead.

The latest version of TNOS (2.20) has http server within, just a case of
plonking your 'index.htm' file into the http dirtectory, and then adding
'start http' to your autoexec.nos file.

Anytime now the next release will be available too, that has a 'limited'
but usefull http browser too ;-)

Check out http://lantz.com for TNOS home site.

>
Pactor doesn't care what the polarity is (RTTY and Amtor do). Pactor can
use either FSK or AFSK (via the mike input). Pactor-II and Clover are
not FSK and must use the mike input.

743. RE: Mac Ham Software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-03 00:00:00 UTC

JOHN>> On my homepage - as mentioned in January 97 "QST".

Thanks for posting this, John!

I also offer Mac Users some programs and utilities...even though I don't run a Mac myself:

ATTENTION to Details BBS is currently offering these Amateur Radio-related files via its free FTP service:

KEYWORD DESCRIPTION
==========

MAC-HAM List of 75+ Amateur Radio-related files for the Mac available on ATD BBS. 10K/TEXT

NECUTILS Those infamous, difficult-to-locate NEC laptop setup utilities. 17K/ZIP

NICADS Informative article on the care and discharge/charging cycles of NiCad batteries. 14K/TEXT

RFI-TELEPHONE ARRL FAQ dealing with RFI and telephones. 22K/TEXT

WRC-97 As long as the threat to 2M and 440MHz continues, we will update this information package of texts relating to the "Little LEO / WRC 1997" issue. 29K/ZIP

HELP Returns text File with all active KeyWords. 12K/TEXT
==========

How to Use the FTP Server at ATTENTION to Details BBS

The ATD BBS FTP Service is offered as a cost-effective means to obtain information and files from our Bulletin Board System (BBS) - using Internet E-Mail as the method of exchange. Using our FTP Server is as simple as addressing an Internet E-mail message to

ftp@atdbbs.com

containing one or more KeyWords. Multiple KeyWords can be combined in a single Message - but it is very important that there be only ONE KEYWORD PER LINE!

EXAMPLE: You see from the above list of KeyWords that you want a copy of our textfile on NiCad batteries and our Help file. Address your Internet E-Mail...

TO: ftp@atdbbs.com
SUBJECT: [anything here is OK]

...and write the corresponding KeyWord, NICADS, as the ONLY word in the FIRST LINE of your message. And write HELP on the SECOND LINE of your message. That's all there is to it!

ATTENTION to Details BBS Sysop: Clint Bradford
5085 Trail Canyon Drive Internet: sysop@atdbbs.com

Hi there,

I have put a "Ham Radio" page on my personal homepage. It includes some hints and tips to do with our hobby. You are welcome to visit the site at

http://indigo.ie/~murf

If you have any other hints and tips regarding amateur radio, please email me with a view to putting them on my site with credit of course.

Alternativly, if you have any good ham pages that I could link to, then these too are most welcome.

73`s for now

Let me comment on that a bit. FreeBSD is a free implementation
of 4.4 BSD. These are the Unixes that were developed at Univ. of Calif.
at Berkeley over many years and had great presence in
academic environs. This was a separate branch of unix,
as contrasted to AT&T and Bell Lab's System V. Bell labs
was the originator of Unix, but the Berkeley folks
developed the BSD branch, adding TCP/IP as an integral
part of the kernel. This makes a system that just loves
to live on a tcp/ip network, and was the OS that pioneered
the internet.

Actually, 4.4 BSD (FreeBSD, NetBSD, OpenBSD) is not "old"
at all. 4.4 came out about 2 years ago and has even been
upgraded continuously since.

Linux is a more a System V oriented unix-like OS, which recently
has been adding more and more BSD enhancements, so the two are
really growing together.

My particular fondness for the FreeBSD folks is their committment
to proceeding in an ordered way to continue the development of
the BSD system, (The funding was dropped at UC, Berkeley for the
development there), carefully adding code only when it has been
proven. This means that the system tends to not have the
very latest "bells and whistles", but it is very stable
and reliable. My system runs a full-time packet bbs and internet
packet gateway 24 hours a day and has for about 3 years now under
FreeBSD 1.1, 2.05, 2.10 and 2.1.6. I have had only one system crash
in 3 years of such operation and none at all with recent versions.
I beat it pretty well, running Netscape and lots of graphics
manipultation stuff. I'm pretty happy with it.

This is *not* putting down Linux...I just don't have
any experience running it to comment one way or the other.

There is no AX25 kernel built-in for FreeBSD. You have to run
NET or TNOS or WAMPES as user processes. There is support

for DOS/Windows programs that is still a little shakey, but
getting better all the time, using WINE, as does Linux.

There's pretty good support for sound cards and CD roms also.
You won't find as many different kinds supported as Linux
apparently does.

Check out http://www.freebsd.org.

> Let me know when your done..

Maybe you mis-understood me. TNOS actually runs quite well right now
under FreeBSD. The standard shipping version 2.20 needs maybe one
little compile time fixup. 2.21 will be out in a couple of weeks,
and I'm now in the loop to make sure that version compiles and runs
right out of the tar.gz.

Spent the weekend chasing a problem with the TNOS screendaemon that
cropped up in 2.21b3. Am downloading 2.21b4 as I write.

However, if you want to link TNOS to your FreeBSD kernel, the SL/IP
method used by the Linux users doesn't work thru a pty. If you have
a couple of spare serial ports it works out one and in another.
Others have suggested that PPP will work thru a FreeBSD pty pair
but I haven't tried it yet. Another option is to use something
other than the standard FreeBSD slattach to make the kernel
connection.

I think you misunderstood my point. I point was that BSD has been
around longer than Linux. (At least as far as I know). I'm running 10
copies of FreeBSD. 8 here and two where I work..

>My system runs a full-time packet bbs and internet
>packet gateway 24 hours a day and has for about 3 years now under

Wow.. I'm running 2.1.6 on my machines as well. Converted them when I
got the CD.. Prior to that I was running a mix of 2.1 and 2.1.5.. I
use them primarily on the Internet and sort of as a working lab and
training tool. I'm hosting web pages and other things to help defray
the cost.. It hasn't covered the costs yet though..

>This is *not* putting down Linux...I just don't have
>any experience running it to comment one way or the other.

After running FreeBSD, I feel Linux is a bit confusing. The most
current version seems more and more similar to FreeBSD though..

Bottom Line.. Didn't mean to ruffle any feathers.. I think FreeBSD is
a great operating system.. I wish there were more ports available..
I'm in the middle of trying to get ifmail up and running..

350 Hz is a little narrow for all but RTTY. 500 to 600 Hz is more
suitable. GTOR may be a little wider at the higher baud rate.

Beware of sweeping statements that FSK tones are 'LSB' - it depends
whether the kit is American high tones (where the higher pitched tone is
space) or European low tones (where the higher pitched tone is mark) -
they're specced the other way round. With a European PK232, I have to
set my rig to USB! (They're compatible, because all that actually
matters is the shift, which is the same). That's the main reason why you
usually give digital frequencies as the Mark frequency (I subtract 1.445
kHz from a mark frequency to give the dial frequency in a 170Hz shift
mode - the European centre is 1360Hz). The US tone centre is 2210Hz.

Pactor, indeed, does auto-compensate for tone reversal.

>350 Hz is a little narrow for all but RTTY. 500 to 600 Hz is more
>suitable. GTOR may be a little wider at the higher baud rate.

Indeed. A *rough* formula is:
bandwidth (Hz) = shift (Hz) + 2*baud rate

This would give:
45 baud RTTY, 170 Hz shift gives a bandwidth of 260Hz - OK for your 350
Hz filter.
100 baud PacTOR or AMTOR, 200 Hz shift (usual) gives a bandwidth of
400Hz - indicating that a 350 Hz filter is too narrow.

Your best bet for general data use would be a 500Hz filter. It's really a bit too narrow for the highest speeds, but if the skirts aren't too tight, it shouldn't be a problem (remember that the formula is only rough, anyway, and if the highest speeds are possible then QRM is unlikely to be a problem, so you could probably dispense with the narrow filter). Of course, you could do what I do, and have two narrow filters, a very tight 250Hz crystal filter, which is only usable for CW (even 45 baud RTTY doesn't make it through that one well), and a wider 500Hz filter for the data modes...

> a great operating system.. I wish there were more ports available..
> I'm in the middle of trying to get ifmail up and running..
The reason why I didn't go FreeBSD when it was introduced was that it
was "BIG", how times have changed, size is now no object and Linux has
also ballooned up in size. I haven't seen any but favourable comments
from linux users about FreeBSD and at one stage it looked like the only
way to get reasonable networking I would have to switch, also I think
FreeBSD users with other requirements must have thought of switching
over to linux, now it seems you have the same goodies on both and the
reasons for switching are not there again.
Before Linux-2.1, I had ax25 compiled into the kernel but never used
it, staying with LNET (a G7LED version of WAMPES), though at the moment
G7LED and some others use kernel ax25 with LNET attaching to it. With
2.1 I use LNET standalone for 1200 baud TCP/IP and 9K6 with a USCC card
I'm forced to use kernel ax25 with lnet attached via ttys/ptys pair.
On the point that Linux is confusing, I find other Unix versions
DIFFERENT, but my knowledge of Linux allows me easily to bridge the
differences nicely, so you quickly get into the swing of things and soon
forget the differences. Many of my friends using NextStep, Solaris, SCO
and the rest in their work environment have come from a Linux background
and haven't found life any less interesting having to deal with them,
perhaps it's because you have to keep learning Linux as it evolves and
see life as a bit drab when there is nothing new to learn. I think this
has given the linux developers tremendous latitude knowing that any new
changes will not start a war and that initial problems will melt away.
An example of that is that with 2.0 stable, I was OK with up to 2.1.3,
every other 2.1 kernels up to 2.1.23 was broke in some way or other and
2.1.24 and 2.1.25 are settling down nicely, allowing me to switch
permanently. I gather most FreeBSD people would have head spin at the
constant kernel changes seen in linux, but linux users have seen the
benefits of the changes and accept it as a fact of life as kernel
recompiles and installs are minor matters.

Yes, the TS-450 does a fine job on AMTOR/PACTOR/RTTY. You'll want to use the direct FSK mode, (aux. connector on the rear apron), and use the FSK output on your TNC. By using FSK instead of AFSK, you can just dial up the frequency direct, "Mark" is the frequency on the dial, "Space" is automatically offset. With AFSK, you have to deduct the mark freq from the carrier, and besides, FSK works better, there is no audio conversion, just direct frequency shift keying.

You can independently switch in any filter on any mode, I used the 500 Hz filter, it does fine job.

You'll notice the transmitter will run hot and the cooling fan kick on if you run a full 100 watts for extended periods of time. I throttle it back to 50 watts or less, this is usually more than enough for reliable comms in most cases.

Hope that helps.

73, Jon KF7YN

761. Baycom driver for Linux

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-04 00:00:00 UTC
From: michael@PROBLEM_WITH_YOUR_MAIL_GATEWAY_FILE
Message-ID: <5d87eq$kuj@hobbes.cc.uga.edu>
Source record: 31870

I have a 200 MHz Dell computer at home with Linux 1.3.80 running on it. I also have an old Baycom modem that I wanted to try to get running under Linux. My problem is that whenever I try to compile the Baycom driver that I downloaded from Sunsite, I get a make error in the compilation part of the baycom.c. Has anybody else tried to make the Baycom module for your kernel and get the same problem. I do not know the version of my gcc, could that be the problem? Thanks for any help you might be able to give me.

762. Kenwood TM-V7A Packet Problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-04 00:00:00 UTC
From: rlubash@poco.mv.com
Message-ID: <E53nF8.ICG@mv.mv.com>
Source record: 31871

I just picked up a Kenwood TM-V7A which appears to be a great rig. But.. When trying to use it on packet I am experiencing a weird problem. I have a FT-2500 that I have been using for packet and it works with no problems. When I switch it for the TM-V7A I am able to receive packets from the DX cluster and BBS but when I try to connect, the V7A has to try many times and then usually times out shortly after establishing a connection. If it does establish a connection it takes *many* tries to transfer data and usually ends up by timing out after a few minutes. It appears as if the Packet station is not copying the V7A. I have even tried to increase the TX delay on the software (PC Packratt for windows V2.0) and this helped a little to establish contact but still can't stay connected

I have triple checked the wiring and it is hooked up to the 1200 baud RX output/TX audio in /and PTT as it should be. Since it copies received packet information to the computer I assume the receive audio is getting to the PK-232MBX TNC successfully. I have listened to the transmitted signal of the V7A on my HT and it sounds good. I have also adjusted the audio drive to the V7A to make sure it is not over driven or not receiving a high enough afsk signal. I also have made sure the software selection on the rig is set to 1200 baud.

All in all everything seems to be hooked up and set up right. If anyone has any experience with the TM-V7A and digital use that can give me some insight on this perplexing problem I would sure appreciate it.

Thanks and 73

Nice theory, but Adobe sells that program so that when the employees of a
company pirate Photo Shop, Adobe can come in and shake them down for money
by threatening to sue them if they don't 'come clean'. So to offer a
low pain solution, Adobe offers Photo Deluxe.

Actually, I think the labels I've seen allow shipment to Canadian, as well as US, addresses. OTOH, shipment to Mexico would not be allowed.

I'm not sure why this policy exists, but I've seen a label to that effect on both Borland and Microsoft products. I've also bought at least one piece of software that had both US and Canadian registration cards, with the appropriate prepaid postage.

Both of these vendors sell multi-lingual versions of their products, as can be seen during the setup procedure.

Could it be as simple as insuring that the appropriate printed materials are included, for shipment to other countries?

There is/was a ban on exporting *technology* to certain countries such as the former Soviet Union, which included both computers and software. But I *think* exports are even allowed to Taiwan, even with the problem of open software piracy there.

Generally, these export restrictions are a result of encryption
technology being embedded within the product.

Strong encryption software is considered as a munition, and so it is a
serious crime to export encryption software. (Regardless of the fact
that strong encryption software, such as PGP, is freely available
throughout the world.)

For additional information on the whole issue of cryptography policy
see, for example:

Yes the TS450 works great in these modes. Unlike the TS440 which used
AFSK the 450 uses FSK.

Hi Again
Thanks Gary for the info that you gave me it helps out, but I still have a couple of questons. In your setup was you basically running a fixed tuned radio? Does the phasing on the lc phase shift when you change the lo freq. or does it stay constant? Is doing the I/Q aproach better than trying to drop the IF range down to where the codec could handle it. A friend suggested that if the phase would happen to shift while one changes the LO one could possibly use varactor diodes to retune it. Am I tottaly off base on this one?

Thanks Michael

> eye-pattern?

If your scope has seperate X-axis and Y-axis inputs, just connect the "Mark" output of your TNC to one axis and the "Space" output to the other. If it doesn't have seperate axis inputs and is a dual channel scope, there is probably a "Channel 1 vs. Channel 2" mode. If so, connect "Mark" to one channel and "Space" to the other.

I'm using an old small mil. surplus X-Y 'scope for just this purpose. It makes tuning and mode identification easier.

Good luck.

This is because your kernel is definitely too old for this. Upgrade to
at
least 2.0.14, it's in there.
(Your compile problem results from the API change of the request_irq
procedure introduced sometime after 1.3.80; but anyway you should
use a newer driver release, since the one you have most likely has some
bugs)

The best way to improve S/N of CW signals is to reduce the bandwidth. The
bandwidth of a typical IF filter might be 250Hz or 500Hz. The optimal filter
for a CW signal based on matched filter criteria is a function of keying speed
but is typically on the order of 25Hz. This leads to a 10 to 13dB S/N
improvement assuming ideal filters. Of course, if the filters cause other
problems, then narrow filters won't help. For instance IF crystal filters
ring, DSP filter boxes such as any Timewave DSP use Linear Phase FIR filters
to create very sharp narrow filters with constant group delay. Check out our
web site for details http://www.timewave.com.

Hello folks,

Pse let me know if there is a no-code class of licence in your country.

If so, I wonder about the possibilities of work to this class, i.e.

regarding modes, bands and ouput power. Here in YU we have no-code class

allowed only to "talk" modes (AM, FM, SSB), 2m and 70cm, both up to 30 W.

I already have infos for: K, G, VE, VK, DL, YO, LZ, and ZS. Want to hear

from the others. Pse respond before the 8th February when we will have

our annual conference regarding some rule and regulation changes. Tnx!

Are you sure about that? I think that describes a tuning scope technique
which displays lissajous figures (sorry if I butchered that). They appear
as 2 crossed ovals usefull for getting mark and space tuning correct. An
eye pattern looks quite different and is basically generated by super
imposing a signal on top of itself with each one delayed by exactly one
bit time.

The Eye Pattern is described as follows: "The eye pattern can be visualized
as super-imposing a large number of consecutive oscilloscope traces of a
signal on top of one another. ... This can be accomplished by triggering
an oscilloscope on a stable clock signal related to the data signal, but
without triggering the oscilloscope on any part of the data signal itself
(i.e.: the clock is connected to an external trigger input of the scope,
and the data signal is connected to a vertical display input of the scope)."

The above quote is from Wireless Digital Communications: Design and Theory
by Tom McDermott, N5EG (A very good book in my opinion)

784. DSP-232 problems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-05 00:00:00 UTC
From: Chip Adams <chipa@eskimo.com>
Message-ID: <32F8CEA8.1BBE@eskimo.com>
Source record: 31887

Can anyone give me a clue as to why my DSP-232 won't transmit a changeover signal (CTRL-Z, <END>) in Pactor mode? Everything else seems to work (marginally--this thing seems to basically suck on Amtor/Pactor). I've tried both AEA's DOS/Windows programs on 2 different computers with no success; same software works fine with PK-232 in place of the DSP-232. Changeover works fine in Amtor mode, just not Pactor. Any help would be greatly appreciated...

>I'm looking for any algorithm that improves the SNR.
>Is there anything available? I'm especially interested in
>algorithms that gives a improvement in Morse decoding.

Well, we have to be a bit careful with terms here. There are three quantities which we sometimes use interchangably, but which aren't necessarily the same things at all. Those are CNR, SNR, and Eb/No.

The basic algorithm for improving CNR is

```
while (CNR < desired)
{
transmitter_power++;
}
```

That will also work to increase SNR and Eb/No. :-)

Now we can also do some CNR improvement in the receiver by such things as improving the receiver noise figure and limiting the receiver passband to the occupied bandwidth of the desired signal. If you are doing DSP at IF, a FIR filter algorithm would be useful here. Again, this will also improve SNR and Eb/No.

We can go a step further with SNR. Here we are interested in improving the intelligence bearing signal's power ratio vs channel noise rather than the gross carrier power to noise ratio. The demodulator of the receiver can play a role here. It should be optimized to recover as much signal power as possible while rejecting as much noise power as possible. A synchronous detector is an example of this. This takes advantage of coherency in the signal and redundancy in its spectrum versus the random nature of noise. This can offer a 3 db improvement in SNR vs CNR in the simplest case of a DSB modulation. We can also employ post-detection baseband filtering to further enhance SNR. This is where DSP filtering is most commonly used today.

Now finally, we can increase Eb/No for some codes. If the signal is coherent, synchronous, and uses uniform symbols, we can use a perfect matched filter in the baseband, and an integrate and dump symbol detector. This takes advantage of the fact that symbol power will add over the symbol duration while noise power will tend

to sum to zero. We can also use other demodulation methods for certain modulations to take advantage of the Hamming distance of various symbols in signal space versus the random noise spectrum in signal space. This can often yield another 6 db over raw SNR. We can also take advantage of FEC to achieve symbol gain vs noise. This is extremely powerful, and can allow process gains of in excess of 30 db in some cases.

Unfortunately, Morse isn't a uniform code, and is normally also not sent in a synchronous or coherent fashion, and it doesn't support FEC coding. Thus we can't improve its SNR or Eb/No over the raw CNR value. That's why machine detection of Morse can be no better than ordinary aural detection of Morse. Using other modulations and codes, we can achieve Eb/No of 40 db or better over CNR in some cases. That's why Morse is generally a very poor choice for weak signal coding.

>base on this one?

As I noted, you need to keep the phase shift accurate to within at least 2 degrees. On 20m, that's equivalent to a frequency change of 77.78 kHz. The VXO I'm using only allows about a 10 kHz shift in operating frequency, so I only have to adjust the phasing network once anywhere in the range and then it is fine.

If you want it to tune over broad spans, I'd suggest you investigate other ways of deriving a quadrature signal. One easy way is to phase lock a VCO to the VXO. That'll automatically give you a 90 degree quadrature signal. Another method would be to operate the LO at 4x the desired frequency and divide it down with flip-flops to get the quadrature signal. Another method would be to drive a walking ring counter circuit with the LO and take the inphase and quadrature signals for the mixers from taps on the ring.

As you can see, you aren't limited to using a simple lumped LC network for quadrature. But it *is* simple, and for the small span over which my VXO tunes, it is sufficient.

I wanted to avoid using superhet technique for a number of reasons, so I chose to do I/Q direct. For a single band radio, there's no contest, the I/Q direct approach is simpler, cheaper, and better. For a multiband setup, the tradeoff is between more LO and quadrature generation complexity, and the complexity of superhet conversions. It may be a wash, but I tend to think that I/Q direct still holds an advantage. If you were to use a Harris DDS chipset, you could cover the span from 100 kHz to 30 MHz in one continous span, and that chipset provides a quadrature signal, so you don't need any separate quadrature circuitry at all. That's what I'll probably use if I ever take this thing beyond the experimental stage.

Wasn't there something called "coherent cw" in the '70s that did exactly
this? As I recall, the system used a keyer which enforced 3:1 dah/dit
ratios and was phase-locked to the carrier frequency (maybe it was
just crystal controlled -- it's been a while). I also believe that
the receiver used an analog integrate and dump detector since the
dot/dash/space timings were exactly known and integrally related.

Basically to establish communications you had to agree on a
frequency (maybe to the nearest few Hz) and a morse speed...
Gasp.

You're right though, none of that high tech stuff would help a
straight key... especially if your fist is as bad as mine...

794. How to MUTE a FT-2500 for Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-05 00:00:00 UTC
From: dkriss@spec.com
Message-ID: <dkriss-0502971741180001@lanrover3.spec.com>
Source record: 31897

Help is needed on how to mute the internal speaker on a Yaesu FT-2500 for Packet operations.

The club sponsored tcpip gateway (ausgw.wb9khl.ampr.org) uses a Yaesu FT-2500 VHF radio for packet and the audio out is interfaced to the TNC via the mic plug.

It works great with one MAJOR problem. The audio also comes out of the speaker and people walk by and help by reducing the volume. This causes the TNC and gateway to be deaf.

The SysOp tried installing a plug in the external speaker port. This mutes the internal speaker but also mutes the audio on the mic plug. He tied to find the speaker and snip the wire but that is too hard on this MIL-SPEC designed radio.

Does anyone have a fix for this dumb Yaesu design? Too bad Yaesu does not offer a constant level audio tap for packet operation.

Please send you comments to Dick Kriss, KD5VU

>73, doug

The reason different tones are used is that it doesn't really matter. What counts is the RF frequency you transmit - your MARK and SPACE RF frequencies. Inside your receiver, the incoming RF frequency can be demodulated into any audio frequency that's convenient for your TNC to handle. The same holds for audio tones you use to generate the transmitted signal. I realize this can be puzzling at first, but spend some time visualizing what's happening at the RF level and it'll come clear.

Also keep in mind that some transceivers don't require audio tones to transmit RTTY - they have a direct FSK input which is simple on-off keying, and the transceiver generates the correct RF frequency spacing. The TS-850S which I use is an example of this type.

We have done extensive bit error rate testing of common modems such as the PK232 and KAM Plus. Optimum filter bandwidth can have a drastic effect on bit error rates. This is because a small increase in S/N has a large influence. Since all filters depart from ideal, the type of filter is also important. Crystal IF filters are quite poor when considering their frequency and phase response. David Wood, G0WZA numbers are about right when considering Crystal Filters. Optimal DSP filters will be somewhat narrower. These filters will have much sharper transition bands without phase distortion. In addition as the modulation deceases (RTTY for example), the optimal filter is a composite of two filters (sort of a double hump camel shape). At higher bauds, the space and mark filters overlap the center frequency.

We have measured 100/1 improvements in bit error rate with both the PK232 and KAM Plus in RTTY buried in White Noise. Signals with adjacent channel interference can benefit from narrower filters than normally optimal.

With optimal filters, tuning needs to be exact. Furthermore many signals are transmited at 170 Hz shift or 200 Hz shift regardless of the specific definiation of the mode.

Timewave filters are used by many people as a standard adjunct to their modems. The DSP-599zx and DSP-59Y have very flexible filter adjustments for

data filters. There is also a built in DSP RTTY modem which requires only a dumb terminal. Test tones are also built in. Please check our web site http://www.timewave.com for details (Complete operating manual for the DSP-599zx is available).

Hi and thanks for reading;
Does anyone have any alignment tips for the TEK900. The local shop wants $69.00/Hr for alignment!.
I have a TEK900 set for 441.1Mhz. I have injected a 3Khz tone and successfully received it on another FM received. So I think the Tx is OK. However, the Rx is where I have trouble. Will the reverse work?

I have recent access to a FM modulator that can generate toe on FM with varying bandwidth and modulation. I do not have a Spectrum analyzer. So I'm hoping someone with a little experience can tell me if listening on a Radio, while watching a Scope for amplitude would suffice?

Feedback welcome, Gabe Nemeth VE3SLJ.

802. DeLorme Tripmate GPS <---> Packet interfacing ??

>73, doug

The reason different tones are used is that it doesn't really matter. What
counts is the RF frequency you transmit - your MARK and SPACE RF frequencies

wrt@eskimo.com

I know that at the RF end it doesn't matter, it's the relative
frequency of the two frequencies. The question is, why do some people
do it differently? And why the apparent geograhical split in that
difference?

73, doug

>straight key... especially if your fist is as bad as mine...

Yeah, Bob, coherent CW is a big improvement, but it still suffers
because of the different dot and dash frequencies, IE you still
can't form an ideal matched filter for the channel because of the
different symbol timings (that costs you an average 2.39 db). You
can use integrate and dump, and that's a big win. But you've also
still got the problem that you're only transmitting energy for 40%
of the required coding information, and you've still got the problem
that the signal isn't antipodal in signal space. Combined, those two
latter factors cost you 6 db compared to a uniform code using an active
two state modulation.

: ed. n1mvp

This is because WAMPES does not know what type of TNC you have, and will
try CRC_16, CRC_RMNC, and no CRC, in that order. Your TNC throws away
the first 2 data packets because it does not understand them.

kd6clo@radio.org wrote:
>
> What is this FreeBSD for amateur radio use?????

Its genuine BSD-can't-call-it-Unix-anymore. Its not specifically
for amateur radio use, but is a very useful OS toward that purpose.

For more details on FreeBSD, start at http://www.freebsd.org/
For an example of what PC hardware can do while running FreeBSD try
ftp://ftp.cdrom.com/ which is a single Pentium Pro typically hosting
1000 simultaneous ftp sessions with a hard limit of 1500.

FreeBSD does not have the amateur radio following that Linux has,
but FreeBSD has been a much more reliable OS for me than Linux was.

I think the hi/lo tone thing came into being some years ago when 850 Hz shift was used. The high tones were 2125/2975 Hz. The 2975 Hz tone would not pass thru the roughly 2600 Hz cut-off of Collins mechanical filters. Lower tone frequencies had to be used. Now that everyone uses 170 Hz shift the high tones are 2125/2295 Hz so it no longer matters which tone set you use. Actually, some controllers now let you set any tones you want, so long as you maintain the proper spacing. That's nice because you can now set the tone to be in the center of your narrow filter passband (assuming you can select the narrow filter in SSB mode.

I think you need kernel version 2.0.x or 2.1.x to use the kernel AX25
facilities. Have a look at the AX25 HOWTO, which is regularly posted
to comp.os.linux.answers.

Unless you want the latest and greatest in Linux kernel technology, I
suggest you go for version 2.0.x (currently at 2.0.28). This is a
'production' kernel which is stable, the incremental versions being
bug-fixes.

Versions such as 2.1.x (and 1.3.x) are 'development' kernels, and the
incremental versions may add new, and relatively untested features.
These kernels may not, therefore, be stable.

73 de Ian, G0TCD.

PS: Looks like you need to do some work on your mail or news browser
set-up. It is curently not possible to reply to your article via

From: fgk@iquest.net
Message-ID: <32f922cc.9826238@news.iquest.net>
Source record: 31900

Hello,

I have a shortwave radio with BFO, and recently have been using a couple of PC programs to decode digital transmissions. One of these programs can decode RTTY. I have successfully monitored the nightly RTTY transmissions from the ARRL, and also some other ham RTTY transmissions in the 3.6MHz area of the band.

However, I often come across signals that sound like RTTY but apparently are not. These signals seem to have a wider FSK spread than RTTY - looks like about 900Hz. The baud rate sounds (to the ear) somewhere between 45 and 100 baud.

Anyone know what these signals are?

KAWIN NEWS - Announcing BeaconClock and KaWin 6.48

It's a double-header! The initial release of BeaconClock,
and KaWin 6.48, and both are ready for download from the
KaWin Home Page:

http://www.mutadv.com/kawin

BeaconClock is Freeware for DXers who share an interest in
monitoring the NCDXF/IARU beacons!

KaWin 6.48 enhancements include:

Receive Window pop-up menu now includes a "Freeze Receive
Window" option. When checked, this inhibits automatic
scrolling to the end of the window after each pop-up menu
operation.

Context Selection Tab pop-up menu now includes a
PurgeContext menu item.

Option/Identifiers now highlights (yellow) all parameters
whose current value differs from the new suggested value.

Option/Identifiers now sets the WTEXT parameter for Kams.

Plus, many more enhancements and fixes - all described in
the Squawk64.wri file.

The KaWin News mailing list has been purged of all problem
email addresses. If your address was inadvertently removed
please accept my apologies and re-subscribe. Please pay
close attention to the email address you provide and/or the
"reply to" address set in your email client.

To subscribe to the KaWin News mailing list, send email to

Actually, most of the NOS systems will do both ip and ax-25 and will
gateway one to the other. NOS (JNOS, TNOS etc.) runs on os/2, win3.1,
win96, win NT, messyDog and Linux. Of course, if you log in via AX-25
or telnet, you'll get the BBS (usually) rather than a user process.

820. Top 10 Mistakes with a Digital Scope

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-06 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-0602970616480001@wd1v.mv.com>
Source record: 31904

If you are getting ready to use a digital storage oscilloscope (DSO), you should consider the most common mistakes made trying to use them.

The Top 10 Most Common Mistakes Using a DSO

* Believing you don't have the time to learn how to master your DSO.

* Starting a session after someone else has used the DSO and not first doing a default reset or going to a known front panel status.

* Undersampling the waveform as a wider time is attempted to be viewed with too short of memory DSO.

* Looking at too small an area of time so the view seldom includes the views of causes AND effects.

* Not getting and reading all of the DSO application notes that address your project.

* Squeezing 4 traces on a single grid and using the volts/div. control to bring each waveform to a little less than 25% of full scale and thus throwing away 2 orders of magnitude of resolution and accuracy.

* Taking only 1 measurement and believing "the truth is known" instead of using persistence, histograms, statistics, etc. to let the scope show what is changing over time. Similar to NOT using FFTs to see what is changing in the frequency spectrum.

* Using a passive probe and trying to measure a high frequency and/or load sensitive circuit.

* Not using the scope's built-in measurements and using cursors or counting grid squares for every measurement.

* Not speaking with others in your company or team that use your model DSO and getting their techniques, front panel set-ups, remote control software ideas, etc. An informal users group can be an incredible asset and save you a lot of time.

821. Wampes & linux problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-06 00:00:00 UTC
From: jackson@net1plus.com
Message-ID: <32f9c514.0@207.77.56.6>
Source record: 31905

I'm running the latest version of Wampes on
Redhat linux. When Wampes is first launched,
I have to wait for the third connect request
before the transmitter will transmit. For
example...I start Wampes, start an ftp session,
and have to wait for the third try before the
transmitter wile fire. The status light
on the PK-232 blinks every time, indicating
the packet was sent to the tnc, but no transmission.
Has anyone ever encountered this, and if so,
what's the cure?? I'm sure I'm just being
stupid again, but can't see my mistake.
Thanks muchly.
ed. n1mvp

822. Why WAMPES?

Newsgroup: rec.radio.amateur.digital.misc

Anyone care to tell me why there is a need for WAMPES. I guess I need some education. I thought the AX.25 stuff was in the kernel and the ax.25 utils?

What else does WAMPES do for me?

Thanks,
Alan

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.misc

The NCDXF/IARU Beacons

One of the most enduring laws of DX states that there are at least two possible explanations for an apparently dead band: 1)propagation is poor, or 2)no one is transmitting. The NCDXF/IARU International Beacon Network addresses the second of these possibilities by insuring that reliable signals are always on the air, around the clock, from fixed locations worldwide. Each beacon uses identical equipment, including identical, omni-directional antennas. These beacons, sharing fixed frequencies at coordinated time slots, offer a powerful tool for evaluating propagation on the DX bands.

When complete, the network will consist of eighteen CW beacons in a time division multiplexed network, sharing a single frequency on each of the five amateur bands: 20m through 10m. The frequencies are shown in the Beacon Clock Frequency display. Each beacon transmits in a predefined ten-second window, repeating every three minutes. The schedule for each band is offset ten seconds from the next lower frequency band. Each ten-second transmission begins with the beacon's callsign followed by four, one-second dashes at 100, 10, 1 and 0.1 watts - four diminishing signals at precisely 10 dB power intervals.

Some of the eighteen beacons are not on-the-air on all five frequencies, others are not yet on-the-air at all. Beacons/bands that are reported by the NCDXF not to be transmitting are displayed in gray typeface. For more detail and current information on the status of the NCDXF/IARU International Beacon Network, visit the NCDXF/IARU web page, at

http://www.ncdxf.org/beacon.htm

OK, so the NCDXF/IARU have established a bunch of beacons out there - somewhere - each transmitting for ten seconds every three minutes on five different frequencies, that we can use to find band openings. But, how do we keep track of who is transmitting when and where to point the beam to listen for the next beacon? That's where BeaconClock comes in - BeaconClock answers the age-old question: "Who's on first?".

BeaconClock displays a real-time list of the next five beacons scheduled to transmit on the selected band and updates this list every ten seconds as the transmitting station changes. Information displayed for each station includes the callsign, short-path and long path beam headings and short path distance in Kilometers. Information for the currently transmitting beacon is highlighted at the top of the list. Armed with this information, a quantitative survey of possible DX paths on each of the five bands takes

just a few minutes.

But enough of this - you can discover the rest on your own. BeaconClock is FREEWARE program for DXers with Windows95 and you can download it directly from KaWin Home Page, at

http://www.mutadv.com/kawin

Source record: 31829

>>Has anyone interfaced a DeLorme Tripmate GPS unit with a KPC-3
>>or KAM for GPS tracking purposes?

Easy to do. Just like any other GPS only you
need to jumper pin 2 to pin 3 of the tripmates DE-9 plug
so that the unit will self start.

Make the required handshake pin high to start the tripmate
from one of the TNC handshake lines. Lots of other options on
where to get power for the Tripmate if you don't want to use Batt.

Lots of info on the aprssig@tapr.org

The APRS docs have extra info on setting the KPC-3 for GPS use.
-- As well as the KPC-3 manual :-)

Body handling: Binary attachment payload not displayed: ALL-MODE.GIF

Hi all

AMTOR, PACTOR, CLOVER, PACTOR-2, ... which one performs best in a "CCIR poor" channel?
For those of you who do not have access to QST, my friend Alf DF7ML converted a diagram from QST into a GIF file, attached to this message, and asked me to publish it here.
In the diagram, PACTOR-1A stands for the original SCS PTC, PACTOR-1B stands for TNCs from other manufacturers offering PACTOR capability.
These measurements were duplicated by a Swiss telecom company. Their results are almost identical (max 5% difference).
Should the attachment be corrupted or otherwise unreadable, please let me know. I never published an attachment before.

PACTOR NEWS is newsletter devoted to HF Digital Modes. With the demise of the Digital Journal, it is very important that we preserve a print medium. So, our publication has expanded from 4 to 6 issues per year and now includes columns on RTTY, CONTESTING, DXing, etc, by some of your favorite writers. (WS7I, K5DJ, W2JGR/0)

It's not only PACTOR any more. Our pages are open for all!

The MARCH 1997 issue will be out soon. If you are not a subscriber to PACTOR NEWS and would like a sample copy, please send a #10 self addressed and stamped envelope with two units of US Postage (or 3 IRCs) to:

PACTOR NEWS
P.O. Box 31
Clayton, Ohio 45315
USA

You can read more about PACTOR NEWS at: hrrp://www.pactor.com

Thank you for reading....

Steve,

Hams on the APRSSIG mailing list have reported success interfacing the Tripmate to APRS. One APRS user in the Twin Cities (MN) has reported using the Tripmate on the local APRS network. The unit apparently needs to get a special code to start emitting NMEA data streams. Turns out, it sends this code when it powers on. So most folks are just connecting the output back to the input and leaving it that way. You might check the APRSSIG archives on the TAPR web site (www.tapr.org) for more info.

834. First Pactor QSO : Advice ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-07 00:00:00 UTC
From: Rich Abbot <abbot@pez.bell-labs.com>
Message-ID: <32FB444C.4FFC@pez.bell-labs.com>
Source record: 31838

Hi Folks,

Last night I (almost) made my first QSO on Pactor,
but there were problems. Can any Pactor-savvy OMs
read the following and comment? My apologies for
the length of this play-by-play...

I am running an MFJ 1276 TNC and an old but trusty
Kenwood TS-430S. Last night I copied a pretty loud
XE station calling a Pactor CQ on 7087. So I tried
to connect to him with a

C XE1QAY

(that might not be his exact call). Anyway I got the
message

*** CONNECTED TO XE1QAY

followed by the string

1wb2mbm

which I've noticed is displayed when a connection is made.
He proceded to say hello and give a short transmission
with his QTH, name, etc. The entire time he was transmitting
my tx was also active, sending short transmissions about
every 2 seconds or so. I thought these might be Pactor
data acknoledgements. He then said "BTU" and expected
me to take the link and give my particulars. But at that
moment I realized that I didn't really have control of
the link, and it seemed that my TNC was still trying to
call his unit even though we were already in the connected
state. I tried to type some information, but in the middle
I got the message

*** Retry count exceeded
*** DISCONNECTED

Over the next 15 minutes we tried various things...he connected
to me, both via the regular connect and also the "long connect";
I made sure that I was hitting my link change character (^Y)
prior to typing stuff (my tx didn't do anything obviously different
in response to the ^Y); he sent me a full screenful of data about
his station during one connect, but I could not reply; and we also
were able to exchange a fair amount of data by sending each other
text in the unconnected state. But each time we were connected,

I couldn't seem to "take the link" and my tx continued to send those short bursts every 2 seconds until we were disconnected again.

Since I've never made a Pactor QSO, it's possible that I am doing something fundamentally wrong ("cockpit error"). I have no local hams on Pactor to test with, or to get advice from. The MFJ manual is devoid of any practical advice about how to actually *USE* their TNC on the air in Pactor mode.

Can anyone on the newsgroup "walk me through" how to properly answer a Pactor CQ and conduct the QSO? I'd like to know

- what should happen as a result of my connect message to the other fellow;

- how my tx and rx should behave when I am in the connected state;

- what I need to do once I am connected...do I need to go into CONVERS mode manually? Do I need to issue the line change (^Y) manually and if so, do I do it prior to or following each transmission?

- anything else important that I obviously don't know yet (hi)

I've gotten some great advice on this newsgroup before, and I'm sure that history will repeat itself in that respect. Many thanks in advance for your insight!

73,

Rich, WB2MBM

835. Re: What is the TOR Bandwith?

Newsgroup: rec.radio.amateur.digital.misc

>
>(I have ordered the 350Hz CW/RTTY filter for the IC706, but I am now
>wondering whether it is too narrow for the faster TOR modes).

350 Hz? I don't know about that one. I know about the 250 Hz filter,
and that's too narrow. And I know about the 500 Hz filter, and that's
just right.

A *crude* estimate of required bandwidth will be 2 * baud + shift.
So the following bandwidths are the minimums

45.5 baud RTTY (170 Hz shift) 261 Hz
50 baud RTTY (170 Hz shfit) 270 Hz
75 baud RTTY (170 Hz shift) 320 Hz

AMTOR (170 Hz shift) 261 Hz
PACTOR (100 bd, 170 Hz shift) 370 Hz
PACTOR (200 bd, 170 Hz shift) 570 Hz
GTOR (300 baud, 200 Hz shift) 800 Hz
Packet (300 baud, 200 Hz shift) 800 Hz

PACTOR II 500 Hz
Clover 500 Hz

(note, these two use specially shaped complex modulations to
stay within 500 Hz for all the effective bps rates they support)

Now one of the reasons these are crude figures is that filters become
very phase non-linear at the passband edges. The degree of non-linearity
is a function of the steepness of the shape factor of the filter. So you
normally need to use a filter that is somewhat wider than the modulation
in order to stay out of the non-linear areas near the filter edges. Otherwise,
the eye pattern will be distorted. The FL-100 500 Hz filter has a fairly
gentle shape factor, so you can push out near its edges with data signals.
The 250 Hz filter has a more aggressive shape factor, and is too tight
anyway, so you'll get unacceptable ringing in the eye pattern. I haven't
heard of a 350 Hz filter for this radio, and don't know anything about its
phase shift characteristics. It is obviously too narrow for some of the
modulations.

Also, rectangular modulations will have harmonic content which pushes
the occupied bandwidth out significantly further than these figures
indicate, IE the steep rise and fall times of the keying waveform are
produced by odd order harmonics of the basic symbol rate. If you strip
these harmonics off during reception, you lose some signal energy, and
you distort the eye pattern, IE you get what is commonly called "ringing".
You can compensate for this to a degree in the baseband filter, but you
don't want to get too aggressive or your BER will suffer.

I use the FL-100 500 Hz filter in my IC-706 for all data modes except
GTOR (which I don't have) and Packet (which I don't use). It works fine.
A narrower filter is likely to cause problems. Note, HAL generically
recomends using a SSB filter for Clover due to the need to stay out of
the non-linear phase region, but I've found that the slope of the FL-100
is gentle enough to work fine with Clover signals, and it sure helps
in crowded conditions.

As I mentioned in another note, there's a trick which will allow you
to use the FL-100 in LSB mode. Lie to the radio in the initial set
menu and tell it you've installed a FL-103 SSB filter. It'll then
let you use the FL-100 in LSB narrow. You have to push the IF shift
control all the way to one end to center the filter on the tones when
doing this, but it does work. This is necessary for PACTOR II, Clover,
or AFSK operation. For pure FSK operation, tell the radio the truth.
It then lets you use the FL-100 in RTTY narrow mode, and positions it
properly automatically. (It also positions it properly for CW when
you go into CW mode.) If you've lied to the radio to use the filter
in SSB narrow, the radio won't let you use it in RTTY or CW, so you
have to go back and change the initial set menu before you can use
it in these modes.

Keep the power down to 50 watts or less when operating in data modes.
You almost never need more power, and the little radio gets unacceptably
hot if you push it. If you run AFSK, make sure the compressor is off,
and keep the drive down to the point where there is no ALC action. Otherwise,
you'll get distortion of the waveform and a higher BER. The data modes
are efficient, you don't need to push things, so don't.

>How do I connect a scope to my TNC in AFSK or FSK mode to show an
>eye-pattern?

Hook the scope sweep trigger to recovered RxC. You can find that at
the RxC pin of the SIO chip. Hook the vertical input to recovered
baseband out of the modem filter (this varies depending on the TNC,
you'll have to hunt for it). Set the sweep rate to a multiple of the
data rate, IE for 1200 baud, set the sweep rate to 20 uS per division.
This will show you a good eye. If you dual trace the scope, TxC edge
should fall in the center of the eye. If it doesn't, that's an indication
the slice level is set incorrectly.

>ear) somewhere between 45 and 100 baud.
>
>Anyone know what these signals are?

They could be medium or wide shift RTTY. 425 Hz and 850 Hz shift
are still used by some commercial RTTY stations. The baud could
be 50 or 75 rather than the 45.5 of amateur operation. The transmissions
may use bit inversion or other encryption techniques, however, so
you may not be able to make sense of them. Another likely prossibility
is that they are multiplex RTTY transmissions. These typically have 4
RTTY signals multiplexed on a single carrier. Depending on how the
multiplexing is done, you may be able to copy one of the channels by
tuning off to one side a bit.

There are decoders available which let you copy these multiplex
signals, and other odd modulations, and let you sort out bit
inverted transmissions. Grove seems to carry several of them.

It is certainly NOT in the kernel of HP-UX, AIX, SunOS, Solaris, IRIX,
... If your kernel has it, then go for it.

> In the diagram, PACTOR-1A stands for the original SCS PTC, PACTOR-1B
> stands for TNCs from other manufacturers offering PACTOR capability.
This is unfair in so far that there are many differing pactor I
implementation of widely varying quality (SCS not necessarily
the best, as it has saturation problems at it's AD converter, at
least the original Z80 box)

> These measurements were duplicated by a Swiss telecom company. Their
> results are almost identical (max 5% difference).
You should probably also mention that this "Swiss telecom company"
makes (some) of it's money to sell PTC-2 boxes to commercial
customers.

Tom

>think you will get 30 to 40 db S/N? Even so 80 CPS (top speed) is
>like watching plants grow.

Actually, unsurprisingly, PACTOR II on the PTC-2 performs best.
Clover also does well. And the Golay coding of GTOR gives it
a surprisingly good showing. Ordinary PACTOR and AMTOR are
generally worse, and plain RTTY worst of all.

Both PACTOR II and Clover continue to work below 0 db SNR,
Clover down to about -8 db and PACTOR II down to about -18 db.
This is a bit misleading however. All the SNR figures are
calculated for a 4.5 kHz bandwidth baseband. This highlights
the effectiveness of the DSP baseband filtering in the PTC II
and in the P-38, but if you were to use narrow IF filters, the
apparent negative SNRs go away. Then PACTOR I begins to look
a bit better, and GTOR's apparent good performance doesn't
look quite so good. PACTOR II and Clover still retain their
edge, however. That shouldn't surprise anyone, they are
highly optimized for the HF channel.

It makes more sense to look at the performance of these systems,
not in terms of SNR in some arbitrary bandwidth, but in terms
of Eb/No. Looked at that way, PACTOR II operates down to about
+10 db. To put that into perspective, the absolute Shannon limit
for Eb/No is -1.6 db, and the best Eb/No performance ever achieved
in practice is the +4 db of Voyager and Galileo. About the weakest
by ear Morse copy is limited to +13 db Eb/No, but that's misleading
too since no one could copy Morse at 40 bps at that level, or even
0.4 bps at that level. Again for perspective, 40 bps is about 5
characters per *second*, or about 60 WPM.

Now 60 WPM isn't exactly flying, even the 120 WPM represented by
80 bps isn't exactly flying, but it is near a spoken conversational
rate, and far superior to OOK Morse at 6 WPM. And to even *do* 6 WPM,
an OOK Morse signal would have to be at least 3 db stronger. This
is seriously good weak signal performance.

And it *is* quite reasonable to often have a 30 db to 40 db SNR
when operating near the MUF. At those levels, PACTOR II, and Clover
especially, really begin to shine. At 16FSM, Clover can attain

750 bps equivalent throughput (450 bps with the P-38 which doesn't have as much horsepower as the HAL 4100). That's 1125 WPM!! That's *very* respectable performance, roughly two typewritten pages a minute. PACTOR II's top rate of 80 CPS is 960 WPM, not far behind Clover's best performance, and PACTOR II can achieve that in somewhat worse conditions, IE 20 db SNR.

Steve is very much too pessimistic about these modes. They are very impressive compared to PACTOR I, AMTOR, or plain RTTY, and very much more impressive when measured against a relatively poor method such as OOK Morse. Of course it isn't the 56 kb we can run on UHF, but then we can't get the *single hop range* on UHF that we can easily get on HF either.

Gary

I have a question regarding the graph... Since most HF data uses
either 200 Hz, or 170 Hz shift, why specify the signal/noise
ratio relative to a 4000 Hz bandwidth?? :-|

Message-ID: <32FBA050.41C67EA6@eecs.berkeley.edu>
Source record: 31847

Thanks to all for the great information on my question about bandwidth.

The FL232 350Hz filter is not really made for the 706. It does fit in it though, and if you lie to the radio (tell it is the FL100), the filter works well for CW and RTTY (it is actually sold as a "CW/RTTY" filter). It is a bit ringy, but the radio seems to center it properly both for RTTY and CW operation. It does work great for RTTY, and I got some strong PACTOR signals through it in some brief tests. I am now replacing it with the FL-100 since it seems that it is a much more usable filter in most of the digital modes.

Since I posted the question I was able to see some spectral plots of various TOR signals in the 96 ARRL Handbook. I also fed the AFSK output of the KAM into a borrowed spectrum analyzer and had the KAM "send" a long ascii file into the analyzer input. From these crude tests it seems that even the 500Hz filter might be a tad too narrow for high speed Pactor. I will wait and see if this is the case in actual use.

thanks again

Costas KE6SYN

Rocklin, CA 02-07-97

I just received the "January 1997" issue of the
"Digital Journal" magazine/news letter. There
inside was a "special announcement" to all
IDRA members, who ever _they_ are that the
issue in their hands will soon be a collector's
item. The announcement goes on to state
that this is probably going to be the last issue.

I had not thought about renewing as after almost
a year I found little of interest to me. Now I wish
I'd never thrown away my old issues of the oil
stained and rosin splashed "RTTY Journal.

Oh, well. Time rushes on.

"I thought the AX.25 stuff was in the kernel..." only for Linux. Do
Linux users currently Assume The Whole World Is Linux, the same as
many Assume The Whole World Is A Microsoft Product? :-)

Diversity is good. There is no such thing as The Single Best
Solution. I think FreeBSD offers a better Un*x environment on
PC hardware than Linux, but your mileage may vary.

There *are* good reasons for AX.25 support in the kernel.

There are good reasons for Un*x TNOS, WAMPES, and KA9Q. Try them
all and find out for yourself.

Hello Rich,

When you make a connect in PACTOR, there is a direction involved.
When you got the ** CONNECTED ** and were receiving type from

the other station, it meant that the link was O.K. In this linked condition, your TNC should be senting a burst of about 0.22 seconds about every seconds (every 0.96 seconds actually) as an acknowledgement. When the link is turned over to you, the sending station (in this case the XE) would "OVER THE LINK" at the end of HIS transmission.

When using an MFJ 1278, I do not know if you automatically enter the converse mode (conversational) automatically, or you need to enter a K from the command mode??? Perhaps someone else can who uses the MFJ can give you more details.

Anyhow, your TNC ought to switch to sending one second bursts of data with a pause (or hole) every 0.96 seoconds to allow the other station to acknowledge the burst when it is your turn to do the sending. So the 'duty cycle' of your station increases when you are doing the sending.

The RETRY EXCEEDED seems to indicate that either you were not in the right mode -OR- got out of sync with the other station. Assuming the other station is not a novice at this (and he might have been) he should have 'OVERED the LINK" So you should NOT have had to do anything (except perhaps enter the converse mode.. see above.. I'm not sure of that!).

When your typing (sending) is completed, you will need to over the link (reverse the direction back to the other station). I am not really knowledgeable about the MFJ-1278 software, so I don't know how your software tells the hardware to 'reverse', but I'm sure it is in your documentation.

That may well be. Microsoft created quite a stir here in Canada when
they held back the french release of Windows95 in Quebec so they could
make packaging differences from that sold in France so that it
couldn't be grey marketed. That could very well be the reason here. I
hadn[t thought of that :)

Yep. Especially "crypto" tech. As if other countries don't already
have as good a system (or the same one). :))

From: in3asw@gpi.it
Message-ID: <5dj2lh$p8g@urano.inet.it>
Source record: 31715

Hello and thanks for reading..
I'm running G8BPQ v. 4.08a with 2 Tnc's (1k2 & 9k6 Bd) on 2 COM
ports.
Issuing the "MH" command on the 9k6 modem port , I got always garbage
calls back. I tried several setting changes in bpqconfig.txt without
luck. Both Tnc's are in Kiss mode , but the problem follows always the
9k6 Bd Tnc. Anybody can help ? .. tnx in advance ...

I'm having some trouble with my tnc/fbb setup. I am using FBB515 for DOS
and BPQ408 and a KPC-3 in host mode. I can start it up but can't get FBB
to reconize my tnc. It doesn't display any errors and it does diaplay my
beacon but I don't see any other traffic coming through when I press F5 to
see all channels.
Please help.
Thanks, Russ-KA9MRU

I tried to reply to this privately but ran into problems so am posting to the group. Sorry to those not interested.

There was an article here on the Pactor News. I would be interested in such a newsletter but am totally blind and I am not interested in print. Is there any possibility of getting this newsletter in an electronic form such as floppy disk or email attachment?

Thanks and 73 from K7RX.

Has anyone used one of these little critters as a software-programmable
TNC/radio modem?

I have (at least) one which I'd like to make good solid use of, beyond the
usual noise and equalizer audio functions. It has such a small form-factor
and already has the analog I/O; digital I/O is just a PLD or two away...

That is all... for now... :-)

Andrew.

Message-ID: <32FD76D7.2BB@HiWAAY.net>
Source record: 31719

Is the Yaesu FT1000-D as good as the receiver on the FT1000-DM which is a dual conversion receiver but backed up by the newest Digital Filtering scheme in Yaesus line?

Any comments on operation if you have one or both or have access to listen to both? I have heard that these radios are the new benchmark for low noise receive and that they run circles around the competition.. something I find hard to believe and have not been able to check it out myself.

Thanks

Gary

> two state modulation.

Just to toss some thoughts out there... Morse code is basically a
four-symbol, variable length code set. The four symbols being dots,
dashes, letter-spaces and word-spaces. If you pass it through the
integrate'n'dump you'll get something like QAM (4 Amplitude levels - I
think I've got the right name) offset by about half a dash pulse of
integration.

It's not a nice, "predictable" digital-type signal, but you do have leading
and trailing edges to synchronize on every dash and dot. What may help is
to pass the raw audio through some noise filtering, then pick off the
edges. You can always make the software more intelligent, have it adapt to
some of the mutual information/common letter and number combinations.
After all, CW conversations are rarely about anything more than the
weather, right? ;-)

Does this help any?

Andrew.

I can almost get jnos ro run with the HP200 and a baycom BP-2 (the regular baypac usinf the tfpcx AX25 driver. I say almost because one time i actually got a connect asking to login to a local packet bbs, but usually it times out (wa8?? refused connection. close session). Is the CPU too slow on the HP or is it a jnos setting? I run jnos and the baycom on my notebook flawlessly.

Help!

I have an unusual problem with a PK-900 (I know AEA is history). This unit has never worked properly. Packet works fine for about 30 seconds after a restart (not reset or reinit). After this short time, it fails to receive any additional packets. I hear the ACKs beint transmitted (using another receiver), as well as the far end sending my TNC data. Before I start into debugging the hardware, I was looking for similar experiences. This problem exists on both ports 1 & 2. The software version I am running is 7.1 dated 15 sep 95.

Any pointers will be appreciated.

Before the chips start flying, try send a file to yourself using a
loopback connection if you have not done so. This eliminates any RFI
and poor receiving audio troubles. You may have to increase the AFSK
out a bit though. Geberally set it to the 12:00 position and it will
work. The loopback connection is in the manual. If it works there
then the trouble is generally elseware. Also only port 2 could use
unsquelched receive audio, it has a DCD state machine built into it.
Port 1 depended on the squelch action of the radio to operate
properly.

Hello Out There...

Anyone have any experience with the 23cm PSK packet-radio RTX for
1.2Mbit/s by Matjaz Vidmar, S53MV in Slovenia?

(those interested can find more info at:

http://www.hamradio.si/hamradio/packet.html

a quite nice site, BTW!)

Anyway...

Sounds interesting at least but due to my eyesite, I have trouble
reading the online schematics and layouts.

Would be interested in the opinions and experiences of those that have
looked at and/or tried this system.

Take Care & 73

Hi Darryl!

There are a few of us in the south bay area (Fremont, Milpitas, Sunnyvale) on 9600 tcp/ip on 145.71. Other calls I see on my system include: vk2xoc/w, wa8drz, kd6aku, ko6ri, kd6cvl, ai6u and wb6ssy. There is also activity in the sacto vally area. Multipath is a problem which we mitigate by using beams. Beams exacerbate the hidden transmitter problem but that hasn't been much of an issue (yet).

Steve-
First make sure your MBX is not stuck in host mode. That one fooled me after I converted my plain 232 over to an MBX. If I remember correctly, there is a jumper on the board that removes the backup battery temporarily so that the MBX defaults to factory settings (non-host mode).

I have successfully repaired both my 232's in the past but shot-gunning it is probably not the most effective way. Try to get some databooks (Zilog, standard TTL, memory) and you will be in a better position to fix the unit. Often the problem is obvious and can be traced to the source. For instance, the last time my plain 232 died, I found that the SCC (serial controller chip) was bad by using a scope to look at the pins. It was getting input data from the Z80, but the TxD line was stuck in one state. Shot-gunning will often fix units with bad chips, but what about one of the most common problems, a bad physical connection?

It would be helpful to have a spare 232 around for parts. There seem to be a lot of used, cheap AEA stuff for sale now that they are out of business; it will be interesting to see who if anyone does AEA repair work now. Please post if you find anything out.

875. Frequency Doubler ICs?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-09 00:00:00 UTC
From: ianls@patrol.i-way.co.uk
Message-ID: <32fdbbc0.615560@news.i-way.co.uk>
Source record: 31729

I intend building a 10 mtr CW transmitter using a VFO. An oscllator running at 14 MHz and doubled to 28 MHz would be ideal, but do we still have to depend on diode doublers or class C amps to do this or is there a nice little chip? A TTL doubler would also help isolate the VFO from the o/p stages. I've looked thru the usual component catalogues, but can't find anything! But there must be something in the 1000s of lised ICs that will do the trick...

Thanks,
G4JQT

Perhaps the port speed on your computer is not fast enough, or cannot
handle the speed that you are using on it. That has been the usual
cause of garbage calls here.

Fred ke8tq

I may not always agree with what you say. But I will defend to the
death your right to say it.

When you initiate the connect, you will be the information sending station (ISS). Your transmit time should be the longer burst, his transmit will be the shorter burst. What you type will appear on his screen. When you send the "change-over" with Ctrl-Y, he will become the ISS and you will become the information receiving station (IRS). What he types will appear on your screen. His transmission will be the longer burst, you will transmit the shorter acknowlegement bursts.

If you initiated the connect to the XE station and he started sending info to you then either 1) you hit Ctrl-Y to give the link to him or 2) he send a "break" to grab the link from you. This is not the normal way to begin a QSO but it could happen. If someone expects you to transmit

and after a few seconds you are still not the ISS then try the "break" command (I don't know what the actual command is for your setup) to seize control of the link. It could be that he failed to send the change over command at the end of his transmission.

It appears that you were doing things correctly per the normal method.

>73, doug

Its mainly a historical artifact. We started using RTTY with a 850 Hz shift many years ago using passive LC filter demods. When some of us started to use narrow shift, we just moved the low tone up. That way we could switch in another capacitor in parallel and still work wide shift stations with the same demod we used for narrow shift. This was in the days before SSB had become popular. We were using FSK transmitters, and receivers that didn't have much in the way of IF filtering.

The Europeans came along later, saw that using lower tones fit better in a fixed SSB receiver filter bandpass and started using those. We should have switched too, but we were used to using high tones, so we still do. We now use narrow filters and IF shift, so the fact that we're using high tones isn't a practical disadvantage. It doesn't matter on the air, of course, except that you have to do a little math in your head to figure out what the mark frequency is, and the math is different for US and European stations.

In the old days, we knew the mark frequency directly because we were using FSK transmitters. Today, lots of people use AFSK, and that can cause confusion. The mark frequency is not the frequency indicated on the SSB radio. When frequencies are published today, they may

mean one of three different things. It can be the mark frequency, the way we did it in the old days. It can be the frequency indicated by a SSB radio. Or it can be the frequency *halfway* between mark and space, IE the occupied channel center. Any of these conventions have a rationale, but it is confusing that there *are* three.

I don't like the idea of using the indicated frequency on a SSB radio because that doesn't tell you where the carrier *is*. I like identifying by the mark frequency, but I find the idea of identifying the channel center compelling too. I can live with either one, as long as it is clearly indicated which is which.

Now there's one other source of confusion. In the US, we use LSB for AFSK while the Europeans use USB. But we both agree that mark is the higher frequency of the pair. That means the keying sense of US and European operators also has to be reversed. Again, this makes no difference on the air, but it does make a difference in how you setup your TU. Now I don't know how that particular difference came about. One way is as good as the other as long as they come out the same on the air. This really is a good reason not to use the indicated frequency on a SSB radio, though, because it would be grossly different for a US and a European station since the tones are on opposite sidebands.

Have been using the TS690 (TS450 + 6M) for several years with the 270Hz filter. Its a bit tight but work quite well on 20M RTTY/Pactor/Amtor after you get used to it. Its too tight for HF Packet, though.

I have a PK-232 that recently stopped sending or receiving anything from the RS-232 port. I've replaced the 1488 and 1489 driver with no luck. I don't have a lot of time (or desire) to mess with it. Can anyone suggest a repair center so I can have the pk-232 fixed?

By the way, the 232 seems to come up fine and go into the last mode.

Thanks,
Kory

Source record: 31739

Hi !

I have in 3 years been running BPQ 408a on my OS/2 3.0 as driver for my PMS software (TPK and some simple terminal programs). I have been using the OS/2 version of bpq. This has worked very well with my TNC2 in kissmode running only 1200 baud. My node is not intended for use for exteral stations, thus i have set Quality=0.

Now I am planning to upgrade my hardware to 9k6, and my question is how suitable Bpq is as a driver for 9k6 on a personal system. I have been told that bpq today does not support 9k6 due to low efficiency ACK prosedures. The hardware platform I am planning to upgrade to is either Baycom USCC or TNC3 (is tnc3 supported by Bpq ??).

I would be very happy if anyone out there who in fact run bpq on 9k6 (if any) could give my an answer to my question.

>What else does WAMPES do for me?

You seem to assume WAMPES is a linux-only program. That is not true,
WAMPES can be run on nearly every operating system *IX. In addition to
this there's a special version (beta) of it, which can be run under IBM OS/2
Warp 3 and 4 (at least I think it will run under 4).
WAMPES is much more comfortable and more reliable than the current ax25
implementation in the linux kernel.
It has a lot of features ax25 in kernel doesn't have (IP "autorouting", auto-login
from AX25 server, auto-creation of user accounts ...).

Its my understanding that you must have BayCom or similar software to
run the BayPac BP-1 or BP-2. They are not tnc's, they are modems. The
palmtop will act as the terminal and the tnc.

897. Paccomm PicoPacket questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-11 00:00:00 UTC
From: kzig@aol.com
Message-ID: <855645527.26450@dejanews.com>
Source record: 31751

I'm new to the APRS and packet worlds, and am looking for information regarding the GPS functionality of the Paccomm PicoPacket TNC w/ built-in GPS.

Specifically, I'm interested in whether the TNC can be configured to provide GPS positions to the host PC from both the internal GPS _and_ from received packet broadcasts. In this mode of operation, GPS positions from both sources would be presented as a single output serial stream on the TNC's primary serial port.

If this is possible, I am also interested in the details of this operating mode, including: 1) the format of the position reports, 2) the steps necessary to configure the TNC for this mode, 3) whether this mode can be made the power-up default, 4) what options are available for configuring the internal GPS position reports, i.e. frequency of the reports, type of reports, etc. 5) What are the power supply requirements for this TNC? Can it be plugged directly into a car battery?

I haven't been able to get this information out of Paccomm, and have been told the manual doesn't deal with the details of the GPS interface very well.

I'd be very interested in hearing from anyone with experience interfacing a GPS to the PicoPacket.

Please respond via email.

If you can, try another serial port on the same computer or a different machine. My PK-232 on my MSYS BBS seemed to go deaf, and the problem turned out to be a bad serial card in the computer. I may well have killed it - I appeared to be using a 25-wire cable between the PK-232 and the DB25 serial port. The PK-232 uses some of the pins on its DB25 to drive a parallel printer using the "Y" cable. As I recall, the manual warns against using a 25-pin cable for this reason.

Good luck and 73,

I have my (old) radio connected to my soundblaster. Is there a software that can read the RDS informatin from the radiosignal on "line in", and tell me what radio channel that's on?

I'm running Windows NT 4.0, and have a CreativeLabs SoundBlaster.

I assume, that you refer to "A Comparison of HF Digital Protocols" in
QST, July 1996. I understand that this article and its graphs were
somewhat misleading, thus another group of authors worked on
clarifications. You can find them at
http://www.pactor.com/compare.html

1) I have an HB9 call, but I'm not member of the Swiss ARTG, and
therefore I do not receive the SARTG publications. HB9 does not
imply member of Swiss ARTG, fortunately.

2) With my original statement I wanted to say that there is a
considerable of financial interest behind this measurement.
Those who did the measurement earn their living from selling
PTC-2 units to commercial customers. I doubt that this measurement
was done to inform radio amateurs, I suspect it was done to
impress prospective commercial customers.

Given the amount of money at stake (not from the amateur market,
but from the commercial one), I wouldn't trust this measurement
too far.

Mike,
This is a matter of a simple IF filter replacement for most
scanners. Although wideband IF filters are not available at your local
Radio Shack, they are available from several mail order places. A
detailed description on how to do this appears in the Weather Satellite
Handbook by Taggart.

Are you into HOT CHAT? We've got the world's largest voice-personal dating system, as well as the hottest, sexiest "1 on 1", "2 on 1", and "PARTY-LINE" chat you'll find anywhere, all in one place! And you don't have to call a 900 number to get in on this hot phone fun!

You can choose from 5 hot programs that are sure to fulfill your every desire!

You can press 1 from the main menu to choose from our sexy "1 ON 1" PLEASURE MENU, then:
*to talk to a BEAUTIFUL SEXY GIRL, press 1.
*for a 1 on 1 session with an experienced DOMINANT MISTRESS, press 2.
*for steamy talk with a LUSCIOUS TRANSVESTITE, press 3.
*for an erotic 1 on 1 chat with an EXOTIC TRANSSEXUAL, press 4.

*for some man to man action with a HOT GUY, press 5.
You'll be billed just $3.99 per minute for your selection.

Or you can press 2 from the main menu to DOUBLE YOUR PLEASURE, then:
*to speak to 2 HOT SEXY GIRLS, press 1.
*to get it on with a swinging WILD COUPLE, press 2.
You'll be billed just $4.99 per minute for your selection.

Or you can press 3 from the main menu to join the GROUP ORGY LINE!
*You can party with the nations nastiest swingers for only $2.50 per minute.

Or you can press 4 from the main menu, then:
*Press 1 to join the FANTASY NETWORK. This is the world's only phone service that allows you to connect with people who share your personal fantasies. This state-of-the-art voice mail system lets you listen to messages from beautiful girls, sexy transvestites and she-males, gay and bisexual males, and dominant women. Leave them a hot and sexy message, then call back to see what erotic message they have left for you. You'll be billed just $3.50 per minute.
*Or press 2 to listen to a hot selection of recorded fantasies steamy enough to make you explode! Choose from beautiful, sexy women's fantasies or domination stories. You'll be billed just $2.49 per minute.

Or you can press 5 from the main menu for the HOT AND NASTY DATELINE, where you can listen, and respond, to voice personal ads from hot horny girls in your neighborhood, including their real names and home telephone numbers! You can also leave your own personal message for people to get in touch with you. Make new friends on the world's busiest voice personal lines! Meet singles or couples, gay or straight; you'll be billed only $2.99 per minute.

***JUST CALL 1-800-756-3906 to use your Mastercard, Visa, or American Express card. The charge is just $2.49-$4.99 per minute, plus a 50 cent connection fee. 18+ only.

***OR CALL 1-900-745-4398. The charge is just $2.49-$4.99 per minute. Must be 18 years of age or older.

Call now!!! YOU WON'T REGRET IT!

Actually, there are 5 states to Morse, you left out the intra-letter
space. But only 2 of the states are transmitted when OOK is used, the
dot and the dash. So you don't get a QAM-like constellation. Instead
you get two detectable states and three unknown states that you have to
infer from context. This is a horrible code design for a gaussian noise
environment. (Of course OOK Morse was designed for the landline where a
high SNR is guaranteed by the nature of the transmission medium. It was
never intended to be used by radio.)

>It's not a nice, "predictable" digital-type signal, but you do have leading

>edges. You can always make the software more intelligent, have it adapt to
>some of the mutual information/common letter and number combinations.
>After all, CW conversations are rarely about anything more than the
>weather, right? ;-)

The problem with using differentiation to do edge detection is that
the edges contain very little energy, so for weak signal work they
are easily obscured by noise, and any attempt at noise filtering rounds
off the edges and destroys timing information. You need to integrate the
energy of the whole element to get it above the gaussian noise floor. But

you can't do that unless you know its timing, and you can't know that because the code doesn't have equal length elements, so you can't be sure a priori where one element will end and another start.

The solution to that problem for Morse is out of band clocking. By synchronizing transmitter and receiver to an external timing reference, the element edges can be precisely lined up on dot interval boundaries. You can then integrate each dot interval separately and piece together all the elements of the characters. This is what coherent CW does.

For example, an 'E' is a letter space followed by transmitted energy for one dot interval, followed by another letter space. A 'T' is a letter space followed by *3* consecutive dot intervals of transmitted energy followed by another letter space. An 'A' is a letter space followed by one dot interval of transmitted energy, one dot interval of no transmitted energy (the intra-character space), 3 consecutive dot intervals of transmitted energy, and finally by a letter space. Etc. Letters with more than one element have a complicated timing sequence, but the principle is easily implemented *provided* you know where the interval boundaries are. That's what the external clocking does for you.

Wniform codes can carry their own embedded clock in every element, but Morse carries it only in transmitted dots. Since you can't know a priori when a dot is coming instead of a dash or one of the space intervals, you can't do a good DPLL to recover the clocking information from the received code. But using out of band clocking can solve that problem. Coherent CW enthusiasts use a standard time signal as their external timing reference, IE WWV, CHU, or some other standard source available to both the sending station and the receiving station.

The other problem remains that only 2 of 5 of the states of the code are transmitted, and the other 3 have to be inferred against the gaussian background. This gives a serious SNR penalty for the decoder when signals are weak or fading. With strong signals, differentiation can be used on edges, as you suggest, and that lets you derive a clock, and lets you synchronize your slicer to the middle of a dot interval. This makes the decision point of whether transmitted energy is present or not in that interval more noise immune, but that merely gets you orthogonality and not antipodal signaling. For weak and fading signals, even an externally clocked Morse signal suffers a 10*log(.4) = -3.98 db penalty on average compared to a code which transmits energy for every element in an antipodal fashion. Depending on the text being transmitted, the penalty can be worse, but it can never be better than -3 db. Without the external clock, the penalty is much worse.

Lacking the advantage of the out of band clocking of coherent CW, about the best you can do is to sample the incoming signal at a rate above the Nyquist limit for a continous dot string at the fastest keying speed you expect to receive, then use a sliding window to examine the energy of the signal over groups of samples to try to find where the element edges *should* be. Then you can go back and resample the signal using that information.

You need to be able to hold several seconds worth of samples in memory to make this work. Once you have a trial decoding, you can use contextual clues to evaluate it to see if it "makes sense", IE forms valid letters. If it doesn't, you can displace the clock phase and try again. (You can do this very quickly at machine speeds, so the reception lag is essentially only the lag attributable to the amount of sample you hold in memory at any given time. This is a serious case of "copying behind". A manual operator can't hold this much information in his head, so he can't copy this far behind.)

This can get you the most probable alphabetic sequence which was sent, but there is no deterministic way of gauging a confidence factor for that probability. You can't know whether an element was corrupted by channel impairments, or whether it was actually transmitted in error, IE the other operator made a keying error (you can use a soft decision heuristic in the slicer to give you clues about when you might have experienced a channel impairment however). You can then apply a heuristic to see if the alphabetic string *spells* something which makes sense, or whether it is just gibberish. If it is gibberish, you've probably made an error in element timing extraction, but it could be that the sending operator is just a chronic misspeller. (This is where the human operator has an advantage, he can apply a more complex heuristic to determining if what is spelled, or misspelled, makes sense.)

There is no absolute assurance possible that you've received and decoded the message properly because there is no explicit error check sequence sent. Nor can simple repetition of a message assure you of eventually getting it through error free. Every attempt could have one or more errors, distributed in different parts of the message, but you have no idea *where*, so you can't combine the retries to form a complete message. If FEC were used, however, you could know where the errors were in each attempt, and if there weren't too many consecutive errors, correct them on the fly. You could expect with confidence to be able to eventually piece together the entire correct message. And you can statistically expect to do it with many fewer retries than if you only know an error exists. If you can't even know an error exists, then the situation becomes hopeless. That's the case with hand sent Morse, you can never be 100% sure you've copied what the other operator intended to send. (With fairly strong signals, you can be *pretty* sure you've copied it correctly, but never 100% sure.)

Modern codes and protocols *can* give you 100% assurance that you have a correct copy of the message sent. And antipodal modulations give you a *minimum* 6 db advantage in gaussian noise over OOK. Combining FEC coding gain with the coherent antipodal signaling of a modern signaling system, you can expect to operate (with some level of retries) at signal levels as much as 30 db (raw SNR number) below where OOK Morse operation (at the same rate) is possible.

The advantage acrued in Eb/No is much less, *but* because you don't know where the bits *are*, you can't exploit Morse beyond raw SNR,

so you can't realize the full Eb/No potential of the Morse signal.
You can exploit the full Eb/No potential with a modern coding, and
that's where the big coding gain advantage occurs for modern techniques.

Note that the integrate and dump technique gives you a Eb/No
gain which is proportional to the square root of the bit time.
In other words, for every 4x you slow the code rate, you get
a 3 db improvement in Eb/No. Now in practice, a human operator
cannot work much below 5 WPM in a gaussian noise channel. The
mental integrator doesn't have a long enough time constant.
But machine sent codes can be slowed to an arbitrary degree.
This is exploited by the Lowfers in systems where a bit time
is up to 100 seconds in duration. That gives a 13.9 db improvement
in Eb/No over the best which a human operator can achieve by ear
with Morse. Combined with the other factors listed above, this
can allow signals to be copied which are 50 db (raw SNR) below
the threshold of audible copy for Morse. (And that's with zero
decoding errors too.)

Now that may not sound very useful, but using a compression technique
called "common codebook compression", it is easily possible to compress
20 WPM text into a 3.33 bps transmission rate, IE a compression factor
of 7.2:1. So instead of taking 2,400 seconds to send 20 words, you can
send them in 333 seconds. That's slow, but for the low content of the
typical amateur QSO, it isn't intolerably slow given that the SNR can
be more than 50 db below the weakest level usable by ordinary by hand
and by ear OOK Morse. (Note that's raw SNR in a fixed bandwidth capable
of holding either emission. The Eb/No can't go negative, at least not
more negative than -1.6 db, because of the Shannon limit. What's being
exploited here is the gross difference between OOK Morse and a better
technique in the *utilization* of the available Eb/No.)

Note too, that if you *don't* slow things down, IE if you maintain
the 20 WPM information rate, this technique is also a way to pack
many more QSOs into a given amount of spectrum than achievable using
ordinary OOK Morse. As noted in another post, 20 WPM OOK Morse occupies
about 83 Hz, this emission can be coded efficiently into 1.665 Hz. That
gives a band packing density of 50x what is possible with OOK Morse.
And since it is antipodal and coherent, and can use FEC, it can still
operate at least 30 db (raw SNR) below the level at which 20 WPM OOK
Morse becomes unusable. This means less QRM because everyone can run
less power, and that can improve frequency reuse, so packing densities
beyond 50x become practical. Who said our bands are too crowded?
They are only crowded if we persist in using inferior techniques.

Gary

Hi, Rich...Bill in College Place, WA here.

Bob did a good job explaining PacTOR QSO. I believe you wanted to know what the string "1wb2mbm" was. The XE stations TNC sent you the WRU (Who aRe yoU) query...and your TNC was answering "de wb2mbm".

PacTOR is great fun...you will have a good time with it. 10/15M has been open here every day for the last week or more. Hope to see your print soon.

It doesn't require much of anything in the way of station equipment (power, antenna, TNC) to enjoy the digital modes. The one single thing that makes pactor enjoyable is the terminal program. You didn't mention which program you are using, but may I recommend XPWin? It's a true windows program...no [Ctrl-Y] stuff to remember...just buttons on the toolbar to push with a click of your mouse. The program is written by Gary, KF7XP, and at the moment seems to be the most popular program. About half of the guys I work on Pactor run it. It is available as a free download from Gary's website...and the program is self-installing, with a de-install program included.

73...de Bill, k7rd@bmi.net

***Speaking of "Firsts"...this is the first time I have tried a response to a newsgroup.

The node running at my home has 4 9600 baud ports, 4 1200 baud ports,
and one link over ethernet. Running BPQ 4.08A. Works fine.
Have never heard of any "low efficiency ack procedures" and certainly
do not notice any problems at all with the network links, including
the fast link via ethernet.

Today is usesd my scanner Bearcat UBC 9000 XLT and the program WXSAT
(soundblaster) to receive NOAA pictures.
It works GREAT !!! I get the compleet pictures, a friend of me have a
real NOAA receiver and we putt the two pictures together and they are
the same. So my scanner works great to receive weather sattelites on
+137 Mhz.

No modifications on my scanner, and i use a normal dualband antenne for
144 Mhz and 440 Mhz.

[likewise]

: The problem with using differentiation to do edge detection is that
: the edges contain very little energy, so for weak signal work they
: are easily obscured by noise, and any attempt at noise filtering rounds
: off the edges and destroys timing information. You need to integrate the
: energy of the whole element to get it above the gaussian noise floor. But
: you can't do that unless you know its timing, and you can't know that
: because the code doesn't have equal length elements, so you can't be sure
: a priori where one element will end and another start.

True enough...you are much better if you want to go this route to try to
detect the "middle" of a pulse..that's precisely how the newer GRAPES
modems work..they estimate the timing for the middle of the pulse and do
their sampling at that point.

: The solution to that problem for Morse is out of band clocking. By
: synchronizing transmitter and receiver to an external timing reference,
: the element edges can be precisely lined up on dot interval boundaries.
: You can then integrate each dot interval separately and piece together
: all the elements of the characters. This is what coherent CW does.

This is all a problem of SYNCHRONIZATION. You've mentioned an external
synchronization mechanism here.

: The other problem remains that only 2 of 5 of the states of the code are
: transmitted, and the other 3 have to be inferred against the gaussian
: background. This gives a serious SNR penalty for the decoder when signals
: are weak or fading. With strong signals, differentiation can be used on
: edges, as you suggest, and that lets you derive a clock, and lets you
: synchronize your slicer to the middle of a dot interval. This makes the
: decision point of whether transmitted energy is present or not in that
: interval more noise immune, but that merely gets you orthogonality and
: not antipodal signaling. For weak and fading signals, even an externally
: clocked Morse signal suffers a 10*log(.4) = -3.98 db penalty on average
: compared to a code which transmits energy for every element in an antipodal
: fashion. Depending on the text being transmitted, the penalty can be worse,
: but it can never be better than -3 db. Without the external clock, the
: penalty is much worse.

There is something else you can look for though...assuming that your CW keyer uses a gated oscillator, then you can lock onto the phase/timing of the oscillator. It's not antipodal signalling, but it will still work very well because you can eliminate a lot of noise by a simple deconvolution. Better yet..if the "edge" shapes on the pulses are well known, you may also be able to combat pulse noise and/or fading with knowledge of what a pulse edge is supposed to look like vs. that choppy spike and/or slow fadeout that you see.

Also, you are dealing with a channel with erasures here. So you get three possible states: keyed, not keyed, erased. There's an ambiguity with the not keyed/erased case. So what you do is try both cases and see which one makes the most sense (has the highest probability of being correct).

: Lacking the advantage of the out of band clocking of coherent CW,
: about the best you can do is to sample the incoming signal at a
: rate above the Nyquist limit for a continous dot string at the fastest
: keying speed you expect to receive, then use a sliding window to examine
: the energy of the signal over groups of samples to try to find where the
: element edges *should* be. Then you can go back and resample the signal
: using that information.

This is an application of the Viterbi algorithm. You just need to insert feedback which estimates timing. The Viberbi algorithm provides the maximum likelihood function of the state tree with controllable complexity.

: You need to be able to hold several seconds worth of samples in memory
: to make this work.

Nope..the Viterbi algorithm gives you a general structure for that problem. Tree coders and such also work the same way.

: Once you have a trial decoding, you can use contextual
: clues to evaluate it to see if it "makes sense", IE forms valid letters.
: If it doesn't, you can displace the clock phase and try again. (You can do
: this very quickly at machine speeds, so the reception lag is essentially
: only the lag attributable to the amount of sample you hold in memory at
: any given time. This is a serious case of "copying behind". A manual
: operator can't hold this much information in his head, so he can't copy
: this far behind.)

Do it in two stages. First make estimates on the "carrier present/no carrier present" decision. Then move up to contextual decoding. The reason for two stages is that you really cut down on the amount of data by time you get to the context stage of the game.

: This can get you the most probable alphabetic sequence which was sent,
: but there is no deterministic way of gauging a confidence factor for
: that probability. You can't know whether an element was corrupted by
: channel impairments, or whether it was actually transmitted in error,
: IE the other operator made a keying error (you can use a soft decision
: heuristic in the slicer to give you clues about when you might have
: experienced a channel impairment however). You can then apply a heuristic
: to see if the alphabetic string *spells* something which makes sense, or

: whether it is just gibberish. If it is gibberish, you've probably made
: an error in element timing extraction, but it could be that the sending
: operator is just a chronic misspeller. (This is where the human operator
: has an advantage, he can apply a more complex heuristic to determining
: if what is spelled, or misspelled, makes sense.)

Actually there is. It's called "soft decoding". Unfortunately, a screwed
up transmission is harder to judge..but the same soft decoding algorithm
will still make a best guess. You may dip into the realm of synchronization
errors (missed "dot") for instance, but the principle is the same.

: There is no absolute assurance possible that you've received and
: decoded the message properly because there is no explicit error
: check sequence sent. Nor can simple repetition of a message assure
: you of eventually getting it through error free. Every attempt
: could have one or more errors, distributed in different parts
: of the message, but you have no idea *where*, so you can't combine
: the retries to form a complete message. If FEC were used, however,
: you could know where the errors were in each attempt, and if there
: weren't too many consecutive errors, correct them on the fly. You
: could expect with confidence to be able to eventually piece together
: the entire correct message. And you can statistically expect to
: do it with many fewer retries than if you only know an error exists.
: If you can't even know an error exists, then the situation becomes
: hopeless. That's the case with hand sent Morse, you can never be 100%
: sure you've copied what the other operator intended to send. (With
: fairly strong signals, you can be *pretty* sure you've copied it
: correctly, but never 100% sure.)

There are ways to combine results. With hard decisions, do the old "best 2
out of 3" approach. With soft decisions, you can weight the received data
according to how good it looks.

: Modern codes and protocols *can* give you 100% assurance that you
: have a correct copy of the message sent.

Nope. This is never true. But you can reduce the probability of error to
say somewhat less probable than the chance of all of the electrons in your
radio tunnelling out into space simultaneously.

: And antipodal modulations give you a *minimum* 6 db advantage in gaussian
: noise over OOK.

At the expense of synchronization problems. There are some heavy advantages
to orthogonal modulations, such as robustness in the face of noise and
trivial suboptimal or nearly optimal receivers.

: Combining FEC coding gain with the coherent antipodal signaling
: of a modern signaling system, you can expect to operate (with some
: level of retries) at signal levels as much as 30 db (raw SNR number)
: below where OOK Morse operation (at the same rate) is possible.

True enough...then if you go to a turbo code, you can operate at 0.5 dB or even a little below that (negative decibels) at a coding rate of around 0.25. And at that point, even using computers and some serious horsepower to beat out human operators, they're not even close to error rates of less than 1%.

: The advantage acrued in Eb/No is much less, *but* because you don't
: know where the bits *are*, you can't exploit Morse beyond raw SNR,
: so you can't realize the full Eb/No potential of the Morse signal.
: You can exploit the full Eb/No potential with a modern coding, and
: that's where the big coding gain advantage occurs for modern techniques.

Ahem...realize that in almost ALL of the information that you are quoting from, they conveniently IGNORE the problem of synchronization. Synchronization is NOT necessarily a trivial and/or solved problem, especially if you want burst and/or packet transmission. Morse code is an orthogonal, not antipodal, code, so you can't trivially make the "on/off/erasure" decision, but it's not as bad as you make it out to be. Remember...antipodal signals get you a net gain of only 3dB (assuming coherence in both cases). And quadrature signalling gets you double the bandwidth at the same SNR.

The reason I'm harping on synchronization is that I've been working on designing a high speed packet relay in the range of 1 mbps with packet sizes on the order of less than 10,000 bits (for switching purposes). At that size, if you were going to go for say spread spectrum with a spreading rate of say 100, without a matched filter and lots of other tricks, you are dead in the water because a sliding synchronizer which takes a half second or so is just way too slow. And that's a typical implementation.

913. Re: Frequency Doubler ICs?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-11 00:00:00 UTC
From: pecampbe@mtu.edu
Message-ID: <5dqode$to@metlab2.my>
Source record: 31767

Ian (ianls@patrol.i-way.co.uk) wrote:
: I intend building a 10 mtr CW transmitter using a VFO. An oscllator
: running at 14 MHz and doubled to 28 MHz would be ideal, but do we
: still have to depend on diode doublers or class C amps to do this or
: is there a nice little chip? A TTL doubler would also help isolate the
: VFO from the o/p stages. I've looked thru the usual component
: catalogues, but can't find anything! But there must be something in
: the 1000s of lised ICs that will do the trick...

Simple methods:

1. Use a PLL to double it. Use a second VFO (the usual paired inverters in a free running astable oscillator will probably work). Now half the output (use a flip-flop to do a divide by 2 operation). Then mix the two (XOR the VFO output and the half-frequency VFO together). Then filter the output "difference" signal and apply the voltage to your second VFO as a tuning voltage.

2. Use diode tricks (simplest in doubling is to use the diode as a nonlinearity to generate harmonics).

3. Feed the output to an inverter (add more inverters in pairs to increase the propagation delay and reduce harmonics). Then feed that output to one input of an XOR gate. Feed the other output to the input. Assuming you manage to delay them by 1/(14 MHz), then you've managed to fake quadrature and you'll get a doubler (check...just calculate the result of sin(f*t)*cos(f*t).

Less delay will simply cause harmonics to appear because the output pulse shape is not symmetrical..but then you're already using a filter since your TTL circuit is digital.

One serious problem I can see though...in these days of crystal controlled digital PLL synthesis, why are you not building a REAL PLL which is locked to a crystal controlled low frequency oscillator with a digital frequency control, or (at the relatively low frequencies you are dealing with here) going to a full blown digital sinewave oscillator (digital frequency synthesis)? The parts for the PLL at least are extremely cheap.

914. Re: DeLorme Tripmate GPS <---> Packet interfacing ??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-11 00:00:00 UTC

KANTRONICS KPC-3 AND TRIPMATE GPS INTERFACE
The following represents the efforts of WB6JAR and N6KZB, with input from WK5M, to interface the Tripmate to the Kantronics KPC-3. We found that it worked better than anticipated in satellite acquisition and direction of travel. Despite the help offered via the APRS SIG group, the following is the only set up that worked with our units.

PIN OUT CONFIGURATION
Tripmate KPC-3

pins 2&3 tied together--then both connect to---> pin 2
pin 5 connects to---> pin 7
pin 4 connects to---> pin 6

MODIFICATIONS TO KPC-3

Install a 4.7 K resistor at position R-48 to make DSR active, (see parts layout for location of R48). It is at the rear, on the board, between the DB9 and DB25 connectors.

KPC-3 COMMANDS

Refer to KPC-3 manual and Command Summary sheets for GPS version 6.0 firmware.

Abaud 4800
INTface TERMINAL, (not NEWUSER mode)
MYcall to callsign-9, (or your desired ssid)
BText is set as needed
BLt 1 through 4 to desired beacon interval in seconds
GPShead 1 through 4, must be changed to $GPRMC
GPSInit needs not to be set, (since pins 2&3 on Tripmate are tied)
LT 1 through 4 gets filled with GPS info so leave blank
LTP 1 through 4 gets set to your local area agreed upon digi paths
LTRack left to factory default
PMode left to factory default
RPrint left to factory default

Final command is INT GPS, then turn TNC off and back on with Tripmate connected. It will take about 2 minutes for first satellite acquisition.

I am finally gettimg back into packet here in Milwaukee. I have been dark for several years and I now have the time to get back on the air.

1) What are the packet freq's in the Milwaukee area on 2M and which ones are for the use of TCP/IP networking?

2) What is the best release of NOS (any flavor) that is out there at this time for Linux?

3) I am sad to see the Digital Journal die. I used to write for it when Dale Sinner, W6IWO owned it. Too bad.

TIA,

Richard E. Polivka, N6NKO/9

I have a Compuadd 325TFX 386/25 Mhz laptop. Includes 4 meg ram, 64 gray scale vga display, dos 6.22 and windows 3.11. Power supply, battery and case. 3.5" 1.44M floppy, 60MB HD. High speed serial port and bidirectional parallel port. Runs everything. Great for contests, packet, rtty, field day, or whatever, etc. Works great!

I am looking to trade for an Icom AT180 automatic antenna tuner, or SGC-230 automatic antenna tuner for mobile use.

Florida pick-up only. I am located in Melbourne Florida.

Source record: 31772

Having recently unboxed my new FT900, I was reading the owners manual
and ran accross a reference in the digital modes section concerning
1200 buad packet above 29MHZ on FM. I have not been able to confirm or
deny that this is legal in the US, although the information I have
been able to find shows that nothing above 300 bd is allowable. Can
anyone point me to the right answer on the legality of 1200 bd FM
packet above 29MHZ? I'd like to try it if it is legal.
BTW they are using 1200 bd packet in Mexico on 20 meters SSB (and is
that ever tricky to tune!)-i was able to copy a PBBS operating
somewhere in XE land.

> in this forum!

I would love to hear from anyone interested in this subject. I am actively working on finding/building devices to use this band.

I'm supprised as well, and I'm *very* interested in this development! At the very least, I want a transceiver pair to experiment with a friend, 1.5 miles away (let alone my ISP, which is 3 miles away...). I'm picturing a transmitter/receiver interfaced to an Ethernet card in a pc, either via the AUI or TP ports. This shouldn't be too expensive, and would be of windfall benefit to have a 10Mbps Ethernet connection to the Internet!!! (Ethernet encoding requires 20Mbps bandwidth to deliver 10Mbps data throughput) The telcos won't be bringing us anything near this speed for a long time, and even then it will be outragiously priced. Cable TV companies won't do any better (except for isolated pockets), and again, they're overpriced. TCI receintly announced a big scale-back of their Internet efforts. Free airwaves are the way to go for a 'free' Internet! Talk about bypass!!! I love it for being able to give a thumbed nose and raspberry (complete with wiggling fingers!) to those that should have already provided us with reasonably priced, high speed communications. Such was the spirit that gave birth to MCI and countless (well, hundreds anyway) telcos and long distance carriers. RBOC's fear of losing overpriced leased line suibscribership has and will (IMHO) keep them from delivering high speed comms, allowing their lunch to be eaten (again!!!)!

Please contact me if you have knowledge of or interest in this NII development, equipment to use it, as well as the implied opportunities.

925. Chris Greenhalgh FAQ -- PLEASE READ

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-12 00:00:00 UTC
From: kmhebert@seas.gwu.edu
Message-ID: <5drjpu$nin@felix.seas.gwu.edu>
Source record: 31779
Cross-posted to: alt.mcdonalds,alt.food.mcdonalds,rec.radio.amateur.misc,alt.radio.pirate,rec.radio.amateur.digital.misc,comp.os.ms-windows.misc,rec.radio.amateur.policy,alt.support.diet,talk.politics.animals,rec.radio.amateur.equipment,rec.games.chess.misc

THE CHRIS GREENHALGH FAQ
Available http://www.seas.gwu.edu/student/kmhebert/chris.html

This FAQ is Copyright 1997 Kevin M. Hebert. Any use of it without permission of the author is illegal.

This FAQ is intended to provide an objective view of Chris Greenhalgh, and while some commentary is involved, the majority of this FAQ is posts made by Chris Greenhalgh. His own words are allowed to speak for themselves. Therefore, an information between the words "BEGIN AUE and END AUE may be cited freely. Those words are the words of Chris Greenhalgh.

This FAQ will be posted twice monthly on alt.mcdonalds, alt.food.mcdonalds, rec.radio.amateur.misc, alt.radio.pirate, rec.radio.amateur.digital.misc, comp.os.ms-windows.misc, rec.radio.amateur.policy, alt.support.diet, talk.politics.animals, rec.radio.amateur.equipment, and rec.games.chess.misc.

1.) Who is Chris Greenhalgh?

Chris Greenhalgh is a member of the USENET community. He is a frequent poster on alt.mcdonalds, alt.food.mcdonalds, rec.radio.amateur.misc, alt.radio.pirate, rec.radio.amateur.digital.misc, comp.os.ms-windows.misc, rec.radio.amateur.policy, alt.support.diet, talk.politics.animals, rec.radio.amateur.equipment, rec.games.chess.misc, and is an infrequent poster on other newsgroups. He is widely considered to be a net-cop and spammer by other members of these groups.

2.) Why is Chris Greenhalgh considered a net-cop?

Chris has sent email to the system administrators of various netizens. He has done this for several reasons. The most common has been emailing sysadmins when someone from one of the newsgroups has sent Chris an email he did not like.

3.) Does Chris Greenhalgh believe he is a net cop?

No. Chris considers a net-cop to be someone who tells others what to do in Usenet newsgroups. However, even with this limited condition, Chris is still a net-cop. He ordered several users of the alt.mcdonalds newsgroup to take a discussion to email. This was just one example of Chris' chronic hypocrisy. When Kevin Hebert asked Chris to leave the alt.mcdonalds newsgroup in 1996, Chris posted news accusing Kevin Hebert of harboring a desire to take over the group and somehow control it. And yet, when Chris did a similar thing, Chris did not feel he was a net-cop.

4.) Why is Chris considered a spammer?

Chris' posts, at least to alt.mcdonalds and alt.food.mcdonalds, are nearly always off-topic. Alt.mcdonalds has long been a newsgroup which could tolerate the occasional off-topic post, and most posters put up off-topic posts from 10 to 50 percent of the time. This leaves an at worst 1:1 signal:noise ratio. In Chris' case, up to 100% of postings in a given week are off-topic. The ones that are on-topic are generally replies that accuse another posting of lying or making up information about the topic at hand (for factual evidence, see http://www.dejanews.com and search under Chris Greenhalgh).

ACTUAL USENET EXAMPLE (AUE)
Subject: Re: Big Rip-Off

>: : Where's the "racial tone"? All he said was that they speak Chinese.
>: : I don't consider it racist when someone says I speak English, or that my
>: : friend speaks Italian. . . . Get a life!

>: Agree re portion about speaking a language; I feel "... Yellow, ..." adds
>: a racial tone.

So you "feel" when someone calls me "...White..." or OJ Simpson "...Black..."
that is a "racial tone"??

Christopher K. Greenhalgh, N8WCT

END AUE

What does this have to do with McDonald's? Nothing. There are abundant other examples available via DejaNews.

The other major spamming Chris does is his posting of the alt.mcdonalds FAQ. This FAQ, written by Kevin Hebert and contributed to by many others, is copyright material. Chris Greenhalgh downloaded a copy of it, made cursory changes, and took credit for it in the form of putting his name in the From: header. This FAQ differs little from the original accepted FAQ. For the original FAQ, see http://www.seas.gwu.edu/student/kmhebert/alt.mcdonalds.html for an excellent page showing the cursory changes Chris made, as well as what he copied verbatim, see http://home.sprynet.com/sprynet/awilhelm/mcfaq.htm The red represents what Kevin wrote and Chris left behind. The black represents what Kevin wrote and Chris stole. The green represents Chris' additions.

5.) Can you describe Chris Greenhalgh's hypocrisy in more detail?

Certainly. Note: most of the following AUE's come from Chris's post "
Re: ATTN: Christopher Greenhalgh -- give us a break!", message-id
<cgreenha.587.32519F90@magnus.acs.ohio-state.edu> posted 10/01/1996.

>No, no, no, Chris. You deal in exact words. You can't now change your
>mind and say "well that's what I meant," or "it means the same thing."

Sure I CAN.

END AUE

Here, Chris claims that he can say one thing, then change his mindd
later as to what it means. In many other exchanges, however, Chris holds
the poster to the letter of their word. The next AUE also shows that Chris
holds others to a high standard:

BEGIN AUE

>That's NOT what you said. Are you amending your statement now?

Fact is, I cant remeber what i said. :)

END AUE
That last one is particularly hypocritical, considering the following AUE:

Subject: Re: Court System (was Bloody Chicken Nuggets)
From: cgreenha@magnus.acs.ohio-state.edu (Christopher K.
Greenhalgh)
Date: 1996/12/10
Message-Id: <cgreenha.838.32AD8F14@magnus.acs.ohio-state.edu>

BEGIN AUE

Sorry Molly...better look again, you mis-quoted me.

There was a question mark at the end...that makes it a question.

When quoting someone, it may behoove you, and your creditbility
to do so accuratly.

END AUE
Chris often calls people "proven liars" when they make mistakes. Well, in
message-id <cgreenha.838.32AD8F14@magnus.acs.ohio-state.edu>

Chris says the following:
BEGIN AUE

I have in the past participated in off-topic threads...but no longer do
so.

END AUE

That post dates from 12/10/1996. Since then, Chris has made dozens of
off-topic posts . . . including the one containing that quote.

Chris also calls people names, even though (in message-id
<cgreenha.563.32505D31@magnus.acs.ohio-state.edu>) he says he

doesn't:

BEGIN AUE

Just read some of your childish and immature name calling posts...you dont
see
me doing that...I dont have to resort to that level to make a point, or
win any
debate with you.

END AUE

And yet, on rec.radio.amateur.misc, message-id
<cgreenha.326.319DCF5E@magnus.acs.ohio-state.edu>. Chris calls someone a
bigot:

BEGIN AUE

>>Try to ignore drew. He is a narrow minded bigot, who will attack you,

END AUE

And in message-id <cgreenha.334.3184D106@magnus.acs.ohio-state.edu>
Chris says:

BEGIN AUE

This is a medical fact, but still off topic for this group. I will no
further
comment about it here, as it would only be responses to ignorant
uneducated
buffoons anyway.

END AUE

And in message-id <cgreenha.334.3184D106@magnus.acs.ohio-state.edu>,
Chris states:

BEGIN AUE
Is that right? Out of all the messages I got over this, all but 2 agreed
with
me, and stated, in so many words, that you are a homo-phobe buffon, who
has his
head up his a**. (direct quote from one writer)

END AUE

Note that here, he does not directly call names, yet obviously is
directing these names at the victim. There are innumerable other examples.

6.) What do others think of Chris Greenhalgh?

Chris has been referred to as a "pompous ass" (message-id
<199701290337.UAA07695@user2.inficad.com> et al.), a "fuckhead"
(message-id <azzy-2407961232060001@news.io.com>), a "moron"
(message-id <519g1t$2e9@felix.seas.gwu.edu> et. al.), an "idiot"

(message-id <52u7pg$ros@felix.seas.gwu.edu> et. al.) and other names.

However, Chris seems to think that "everyone" is in agreement with
him. Not a selct group of people, not the majority, but "everyone". The
classic example is excerpted for you here:

BEGIN AUE

Subject: Re: LAMBDA
From: cgreenha@magnus.acs.ohio-state.edu (Christopher K.
Greenhalgh)
Date: 1996/04/29
Message-Id: <cgreenha.334.3184D106@magnus.acs.ohio-state.edu>
Newsgroups: rec.radio.amateur.misc

BEGIN AUE

You may have THOUGHT it, but everyone and myself knows the truth (fact)
about
HIV and AIDS.

END AUE

In other words, "everyone" knows the truth about AIDS. In that case,
why is the government spending so much money on AIDS education?

7.) What does Chris Greenhalgh think of others?

Chris thinks very little of anyone but himself. He tends to attack
people who disagree with him. Here are a few examples.

BEGIN AUE

Subject: Re: What can you do??
From: cgreenha@magnus.acs.ohio-state.edu (Christopher K.
Greenhalgh)
Date: 1996/10/02
Message-Id: <cgreenha.741.3252AD3C@magnus.acs.ohio-state.edu>

>So, based on your "feeling" you can dismiss my statement and/or feelings?

I dismiss your statement about being insulted based on how you post, and
what
you. I believe you fabricated the statement, in an effort to argue a point
that you were not winning.

END AUE

In other words, Chris doesn't think someone was insulted by a post he
made, and hence that person is a "liar".

BEGIN AUE

Subject: Re: Let's get on with the Stupid Customer Bashing!
From: cgreenha@magnus.acs.ohio-state.edu (Christopher K.
Greenhalgh)

Date: 1996/09/11
Message-Id: <cgreenha.482.32371FF7@magnus.acs.ohio-state.edu>

>> Try to ignore Tom...he has no constructive input for the group...just
>> immature name-calling, grade school antics, and unsolicitated
>> insults.

[response snipped]

Oh...and I forgat to say...Tom is a proven liar as well.

END AUE

Yet another person who Chris considers "immature", a "liar", etc.

BEGIN AUE
Subject: Re: ATTN: Christopher Greenhalgh -- give us a break!
From: cgreenha@magnus.acs.ohio-state.edu (Christopher K.
Greenhalgh)
Date: 1996/10/02
Message-Id: <cgreenha.592.3251E0F6@magnus.acs.ohio-state.edu>

I attack no one...more fabrications from you.

END AUE

BEGIN AUE
Subject: Re: What can you do??
From: cgreenha@magnus.acs.ohio-state.edu (Christopher K.
Greenhalgh)
Date: 1996/09/25
Message-Id: <cgreenha.529.3249C75C@magnus.acs.ohio-state.edu>
B

Untrue Kevin...another lame attempt by you to discredit me.

I can have a very thorough debate, without resorting to name-calling and
insults.

END AUE

BEGIN AUE

Subject: Re: What can you do??
From: cgreenha@magnus.acs.ohio-state.edu (Christopher K.
Greenhalgh)

Message-Id: <cgreenha.575.325156B6@magnus.acs.ohio-state.edu>

(yawn) Look up the word "prove" Kevin.
[...]

"Aha!"? Gee Kevin...it must really excite you when you think you have won
something over me, eh?

I should have guessed...I mean...all you do here is follow me around here anyway.

Do you play any sports Kevin?

[...]

I only call people who are immature, that conduct themselves that way.

And of course, only people who are proven liars are labled such by me.

And again, you put your foot in your mouth Kevin...I have NEVER called James
immature, childish, OR a liar.

END AUE

BEGIN AUE

Subject: Re: Court System (was Bloody Chicken Nuggets)
From: cgreenha@magnus.acs.ohio-state.edu (Christopher K. Greenhalgh)
Date: 1996/12/10
Message-Id: <cgreenha.837.32AD5AD9@magnus.acs.ohio-state.edu>A
You are a liar Mr. Ortis, and Im glad others are seeing what you really are.

I NEVER flamed you in any way. You are the one on the immature offensive.

>He grammar flamed me
>and when I challenged, he didn't have the courage to respond.

Because I dont post off-topic to Usenet, and dont wish to waste my time with your childish and immature insults.

END AUE

BEGIN AUE

Subject: Re: One total moron
From: cgreenha@magnus.acs.ohio-state.edu (Christopher K. Greenhalgh)
Date: 1996/09/17
Message-Id: <cgreenha.658.323EC9D2@magnus.acs.ohio-state.edu>

Kevin Hebert is a liar...I NEVER claimed or indicated the FAQ was/is my "own work".

END AUE

There are literally hundreds of other examples available at http://www.dejanews.com.

8.) What does Chris Greenhalgh think of himself?

A lot. This is how he justifies his various other problems.

9.) What is Chris Greenhalgh's problem?

It appears to be an inability to separate fact from fiction. Example:

BEGIN AUE

Subject: Re: An open letter to Chris Greenhalgh (Was: Re: Militant
Vegetarianism)
From: cgreenha@magnus.acs.ohio-state.edu (Christopher K.
Greenhalgh)
Date: 1996/04/08
Message-Id: <cgreenha.274.3169005B@magnus.acs.ohio-state.edu>

Here are some facts Kevin:

1. My sig is smaller than yours, and follows netiquette guidlines.
2. I have not, and do not call names.
3. I do not participate in off-topic (vegan) threads.

END AUE

10.) What can be done about Chris Greenhalgh?

An email campaign to his postmaster, root@magnus.acs.ohio-state.edu
or postmaster@magnus.acs.ohio-state.edu is the start. This document has
been emailed to those people. Please contact Kevin M. Hebert
(kmhebert@seas.gwu.edu) if you have further information to contribute to
this FAQ.

THe 2.1 series is the development kernels, I have shyed away from them
and stayed to the 2.0 kernels...and have had some troubles.
specifically, somehow the isalnum() call is broken. Easily patched (I
should detail it). Maybe it is time to upgrade to a 2.1 kernel...but I
FEAR! anyhow, my understanding of a lot of this stuff is that because
the program is constantly listening to the parallel or serial port, and
probably even more so with the sound card, it slows down the system.
Anyone have any experience with this?

> I've made good experiences with Slackware, but I think any other

I had the same problem and after much experimenting, tracked it down to two causes: The keyboard, and RF on the outside of the coax to my antennas. The keyboard fix was to go to a Maxi-Switch keyboard. I tried six or seven different brands of keyboards including two models of Maxi-Switch, and only the Maxi-Switch ones were totally RF-proof, even running 1500 watts output. The model I'm currently using is their 124-key programmable one, and the other was a three or four year old standard 101-key version.

The RF-on-the-coax problem was cured by installing a current-type balun at the feedpoint of the inverted vee.

Prior to both of these fixes, I couldn't run more than about 150-200 watts without the computer going bananas. Now I can run 1500 watts on any band, any mode with no problem. Your situation may be different, but that's what worked for me. Good luck.

I have an old Aea CP-1 that use to hook upto a Comodore VIC-20. I no longer have that VIC-20, however I now own a IBM compatable computer. On the rear of the VIC-20 is a RS-232 port.
I have connected the computer to this, and when tuning into a rtty or cw station I recieve
a bunch of garbage. I do not know if I do not have the com speed/parity/bits correct or if
I need a special program to talk to this interface.

Can anyone help me out on this? It's a AEA CP-1 and I wish to interface it to a IBM compatable computer via the RS-232 port on the rear of the AEA CP-1. The cable is correct,
I use the same one for packet, and an external modem.

Thanks for any information,

Jeremy Cowgar - KB8LFA

> 1200 buad packet above 29MHZ on FM. I have not been able to confirm or
> deny that this is legal in the US, although the information I have
> been able to find shows that nothing above 300 bd is allowable. Can
> anyone point me to the right answer on the legality of 1200 bd FM
> packet above 29MHZ? I'd like to try it if it is legal.

- From the FCC Rule Book:
PArt 97.307(f) breaks down as follows:
1.80-24.93 MHz: 300 bauds max
28.0-28.3 MHz: 1200 bauds max
50.1-148 MHz: 19.6 kbauds max
222-450 MHz: 56 kbauds
Above 902 MHz: no limit.

So, 1200 baud packt is legal on 10 meters and up.

Matthew

Since 2.1.24 they have been OK, I am now up on 2.1.26 running an array
of stuff. I use a PA0HZP USCC card and also do 1200 baud via the serial
port using WAMPES (modified by G7LED) and it all works fine. The
soundmodem sounds a great idea. If you are going to use AX25, you need
to get the latest axutils via sunsite.unc.edu

/pub/Linux/apps/ham/ax25-utils-2.1.22.tar.gz or ftp.cs.nott.ac.uk
/jsn/ax25-utils-2.1.22.tar.gz
2.1 seems to be assuming some stability and I have had no crashes with
it.

I still don't see where you're coming up with this claim that we're
all jealous of you. Yeah, I'm _real_ jealous of a guy who is a liar, a
hypocrite and a net cop.

Let's see... will they make sure the only people who get this are
lawfully elegible? Personally, I think such things go far beyond the scope
of scanning... then again, simply the topic of how exceedingly insecure
such systems are is worth being raised. Yet another reason hard encryption
should be free and unrestricted.

I used to use both an Apple IIE and a IIC on packet before upgrading
to
a Mac plus. Most TNC's will hook up to the Apple II series using a
standard modem cable. In my case, I used a PK232 and an MFJ 1270,
with
great success. I used a program called APR (Apple Packet Radio),
freeware, and also used ASCII Express and the terminal portion of
ECP8,
which is an obscure Apple II operating system. So, there are several
options for using an Apple II on packet, and some good reasons for
doing so, such as the present price of A2 computers
(cheap!cheap!cheap!) and the fact that they emit very little RF.
If anybody needs a copy of APR, send me a disk and I'll run a copy
for
you. I good in the callbook.

I have recently found g3kfn's web page (http://www.ndirect.co.uk/~thebakers/) and I'm going to try to make one of his TNC's. The hardest parts of this project seem to be getting the parts--PCB from england, antiquated parts from here and there.... I think I can scrounge up all of the Z80 parts from the normal list of suspects--email me for a list--but I can only find AM7910's for $40 from Jameco or $18 from Newark. Is there another chip that I can substitute for this or is there a cheaper place to find them?

Heck, for that price, I can just get a used TNC. :) Would it be possible to substitute a TI 3105 for the part with a little fudging? Anyone considered a similar project, but using modern parts--surface mount processors that are still in wide scale production?

Email would be best and I can summarize the responses and post them to the group.

Cheers,
David N0YMV

Jerry, you need special software to decode the information presented
to the serial port of your CP-1. Unlike the PK-232 or KAM, the CP-1
only demodulates the baudot into digital 1's and 0's. You need a
program to decode those 1's and 0's into ascii that your screen will
display. The only PC based software I have found worth a darn is
CompRtty by Dave Rice KC2HO. His vitals follow:

Visit http://www.hamradio-online.com

License data, technological, demographic, political and economic change (such as spectrum auctions) demand a dramatic rethinking of all aspects of Amateur Radio as we find our place in the 21st century. Do not underestimate the challenges we face - if we continue down our present course, Amateur Radio may fade into the static of history. We present a wide ranging, no-holds barred set of critical questions to encourage you to understand the problem and then think through the solutions.

Did you know, for instance, that the FCC rules actually prohibit innovation in modern digital communications? Did you know that our own "voluntary" band plans stifle innovation and tend to create unused bands ripe for the picking by other radio services?

43% of all hams are now Technician class licenses who operate mostly at VHF/UHF. According to a W5YI report, in 1996, the combined total of General+Advanced+Extra class hams actually declined - yet our "incentive" licensing system has all of the incentives at HF - does this make any sense?

We ask a lot of tough questions and we'd like your opinion.

Visit Ham Radio Online (its free - we run the web site entirely as a hobby) at http://www.hamradio-online.com

or go straight to the opinion column at http://www.hamradio-online.com/1997/feb/opinion.html

Don't worry about the Kantronics supplied software. It's pretty crummy, anyway. Use any terminal program you're comfortable with (Procomm, etc) and you're ahead of the game. For really superior results, use the TNC in the HOST mode with one of the after-market programs designed specifically for the KAM (there are a bunch, KA-Gold, KA-Win, XP-KAM, etc). Enjoy your KAM. I've been with mine since 1990 and love it!

You can operate 1200 baud FSK on 10m, but only in the 28.0-28.3 MHz
RTTY/Data subband. Data operation isn't permitted above 28.3 MHz, and
AFSK over FM packet won't fit in an occupied bandwidth of 1 kHz as
required, so that's completely out. AFSK over SSB is equivalent to
FSK, however, and that's cool between 28.0 MHz and 28.3 MHz.
See 97.305(c) and 97.307(f)(4).

>Do it in two stages. First make estimates on the "carrier present/no carrier
>present" decision.

How many levels should this decision produce, 2 , 4 or, say 10 ? (e.g.
99 % certainity carrier present, 75 % certainity carrier present, 75 %
certainity no carrier or 99 % certainity no carrier).

> Then move up to contextual decoding. The reason for two

Why? Because of one post you don't like? Listen: to everyonw ho considers this spam, ask yourself one question: Do I know who Chris Greenhalgh is? If yes, you won't consider this spam, believe me. If you don't, then take my word for it: it isn't spam.

I have gotten several complaints from people regarding this FAQ. To a man, they have included a phrase like "I don't know who Chris Greenhalgh is, but . . . ". And my answer to them is, "If you did, you wouldn't have sent this email".

So grow up.

Hello,

your problem brings up the question, if anyone knows a good web side with
something like an

"Operating handbook for PACTOR"
or
"Operating handbook for digital HAM-modes"

or ..? :-)

If you have bought a multi mode controller you get a handbook also.
There you'll find some basical information about the technical aspects
of the modes and a description of all commands which you need to control
and configure the box, but nothing about how to operate this mode.

Any good info about operating this modes out there on the net?

I am looking for specs on how packets are transmitted in packet radio. I have been able to find information on the data format of the packets themselves on the Internet, but as of yet have been unable to find information on such things as the audio frequencies used, how 1's and zeros are encoded, how they are assembled to produce the individual bytes in packets, etc.

If someone could point me to a source of this type of information, it would be much appreciated.

Thanks,

Source record: 31678

Well,

I have a Casio A-11 and use it for dubm terminal and wireless Internet access all the time. It *is* convienent.

You will want an extra cable (unless you wish to do your desktop replication with IrDA... which works well, and is a real nice cable avoider also) to canabalize since the one they give you is about 2 feet long and a hassle to lug around.

You will also need a Male-male gender changer and a null modem adaptoid... Radio shack sells the only db-9 null modem connector I can find (others are large). These adapters are because the WinCE device acts like a modem from the desktop/laptop view.

Then you just open a terminal window and you are on the air. The diaplay is currently a little slow... even if you connect at (say) 38400, it paints at what looks like 2400 baud.

You can use the Remote Network software if you want to talk to open a PPP session to the server of your choice.

I like mine... and, so far, I've hated all the PDAs.

Regards,
-George w6mt

979. GIF, JPEG scanning service. FREE OFFER! A picture is worth a thousand words! (TnJEpH)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-14 00:00:00 UTC
From: scanning@XXX1324noreply.com
Message-ID: <#DA2PHhG8GA.219@uptgmsnb01>
Source record: 31683

Why don't you print or save this info in case you need it in the future?

Hello Friends,
It's time to take full advantage of the online medium by having your photographs scanned today! Once your pictures are scanned into one of three formats (GIF, JPEG, or BMP) you can do many exciting things with them.

-You'll easily be able to attach them to emails and send them to people your chatting with online. No more having to try and explain what you look like!

-You can also use your photos in all kinds of fun projects: build web pages; design your own greeting cards; make personalized stationary,desktops, and screen savers- the list is endless!

- Scan pictures of yourself, your pet, your vacation, or whatever you choose!

Cyber Services will scan ANY photograph, drawing, magazine clipping, or other artwork to an image file, and email or US mail it (on disk) back to you within 24 hours of its receipt. (You must be able to receive file attachments to get your file(s) via email. Check with your ISP if your not sure.) PRIVACY & CONFIDENTIALITY ARE ASSURED. You'll also receive helpful technical tips on everything from renaming your file to saving time when sending it to people via email.

We scan all our images in 16.7 million colors for best quality. For just $1 extra we can enlarge or crop your photo, blur out a body part, or ad text (such as your name or email address).

Best of all, as a FREE GIFT to you (limited time only), IF YOU CHOOSE TO, we'll reserve you a FREE PAGE (or pages) in our "Internet Date-Site" (Now under construction!!!). This web site contains pages classified by local area and sexual preference. There's also a erotic image gallery (must be legal age to enter), and a "special interests" section. That's right, you can have your own page on the internet for just $4! (Note: You're responsible for answering your dog's email!) Your free page(s) will include any or all of the following: Your scanned photo(s) (You pick which ones- You can have some, none or all of your photos posted on your page), your email address with an icon visitors can click to send you mail, and a brief profile about you. We'll remove or modify your page, at your request, at anytime! When the "Date-Site" opens for business, you'll receive an email notifying you of the address of your personal web page. You can give the address to people and they can view it from any internet
connection! There are millions and millions of people on the internet.It's

time you start meeting them! (This service won't be free for long so act now!)

If you have any questions regarding our services, please call us at (541)744-5718.

Ordering Information:

Price: $4 for first scan, $3 for each additional scan
Extras: $1 each to add personalized information. (name/email)
$1 each to have image modified (enlarged, body part blurred, etc..)
$2 to have image files mailed to you on a floppy disk (IBM or MAC).
$1 credit card processing fee (Visa/Mastercard users only)

If you would like your photographs returned to you please include a self addressed stamped envelope. Otherwise they will be destroyed.

Order Form (PRINT OUT or COPY CLEARLY):

Name (optional):

Email Address or Screen name (PRINT CLEARLY! You must be able to receive file attachments. Otherwise include $2 for shipment on floppy disk.):

Address (optional unless having shipped on disk):

Phone number (optional):

File type (GIF, JPEG, or BMP. GIF recommended):

Extras (Exact personalized info you want printed on scan):

Hi,

ARe there any groups/individuals out there who have experimented with
ethernet accross microwave links? It is possible (in theory) and the
possibilities are huge......

I'm doing a degree in Computer Science and looking to develop
applications for radio based internets (or are they intranets?!)

Any ideas please?
Matt Green (G7PFI)

For DOS software, look at http://home.pages.de/~flexnet
(PC/FlexNet), and for linux, use one of the more recent
kernels (2.1.22 builtin, or 2.0.29 + ax25-module-patch11 from
Jonathan Naylor)

73s
Tom

Is there anything out there in Internetland that will allow me to use my
Soundblaster and some soft of DSP to run 1200 BPS packet?

I would like to run 1200 BPS packet to connect to a local BBS, not via
TCP/IP or NETROM, etc. I just want a dumb terminal access via the
soundcard, or possibly some small external circuit.

Any ideas?

Thanks Dave N0TGD

[rest deleted]

Gary,

You make a lot of good points and clearly understand communications and information theory; I think I should clarify/elaborate on my thoughts.

Yes, there are two OOK format signaling states in CW (the signaling "alphabet" - 0,1); symbols are generated by combinations of these states over time. I'm thinking of the dots, dashes, letter-spaces and word-spaces symbols as variable length codewords. The empty/off portion separating dots from dashes is a suffix of the symbol. If you think of it in Digital terms, a dot is (111111100000), a dash is (11111111111100000), a letter-space is (00000000000) and a word-space is "longer than a letter-space".

You may have noise in the sampling instances, but the ADC usually samples much more frequently than the human hand sends the code. Dashes have more 1's than dots and about the same number of trailing 0's; letter-spaces have more 0's than dots and dashes and word-spaces have more 0's than all the others. It's just a little adaptive filtering; there are known average dot, dash, letter-space and word-space that can be used as starting points.

The QAM-like constellation I was referring to is what you'd get after sending this VLC through your sample-and-hold/periodic-integrator. You would need to bias the decision threshold so that dashes appear above dots

above the "zero", with the letter-spaces above the word-space, both below the "zero".

It's all software and very sharp band-pass filtering. ;-)

Yes, signaling systems like QPSK are significantly more efficient, IF you have the equipment to encode and decode the signals in the first place. The beauty lies in the fact that you don't NEED a computer to encode or decode CW; it's the most "flexible" human-computer, computer-computer, human-human information transmission mode I know of. Voice wastes bandwidth, voice-recognition on a computer is MUCH more computationally intensive and computer voices leave a great deal to be desired. I propose we convert all voice bands to digital and keep the CW portions since obviously they are far more efficient. (Just kidding. hi hi :-)

It's all a matter of perspective. Most people I know can't listen to an ASCII bit stream, even at slow speed, and determine what the computer is transmitting. ;-)

Andrew.

Hello... Brian here!

If you have a RADIO and a SOUND BLASTER (or compatible card) you already have all the hardware necessary to receive WEFAX, FAX, SSTV and RTTY.

You can also transmit monochrome FAX and SSTV, with the current version of my FTV software.

*** Put the power of your 80386, 80486 or Pentium processor to real use ***

The external "decoder" units that are used by conventional users are modelled inside this software. This makes it easy to get started, inexpensive and rids you of the inevitable tangle of wires and boxes of decoders.

Absolutely no external hardware, other than a simple audio lead, is required by FTV. The current version decodes:

WEFAX (from weather satellites, e.g. 137-138 MHz)
HF-FAX (from terrestrial stations)
SSTV (from radio amateurs, e.g. 14.230 MHz)
Baudot (press, naval, weather etc)

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) The incoming signal is analysed automatically - standard modes, line rates, baud rates and keying polarity are automatically determined following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

*** What are you waiting for? Try it now! ***

Take a look at my web site for futher details, from where you can download an evaluation copy, at: http://www.geocities.com/SiliconValley/2504

Registration promotes the further development of this software and entitles the user to future upgrades paying only for delivery expenses, if any.

Finally, just in case some of you have trouble accessing my web site, here is my postal address (if you want a reply, send a self-addressed label and IRC's to cover expenses):
Brian E. Cauchi,
Gawhra, Domenico Cachia Street, Birkirkara BKR06, MALTA.

What can I say? Try it, and may you have as much fun as I am having...
73's from Brian.

http://www.mtechnologies.com/mthome for ham software, kits, the CQC, more!

I've come by a supply of disposable anti-static wrist straps, which are a great (and safe) way to make sure that you are grounded when working with static-sensitive devices such as CMOS integrated circuits. Sure, you can run a clip lead from your wrist-watch or ear lobe to a convenient ground, and that will take care of static. But it will also route any high-current electricity that you happen to come in contact with, and is a bit like working with your bare feet on a wet floor. The SAFE way to do it, as with these straps, is to incorporate a current-limiting resistance so that static will be grounded off without an increased risk of electrocution.

While I've started including one at no charge with the Island Keyer kits, I've got more than I really know what to do with. So here's the deal--

Send me One Dollar ($1.00) and an SASE with 55 cents postage on it and I will send you FOUR wrist straps.

I'll also include some product literature since it won't increase the postage cost. Or if you are ordering something from Milestone Technologies via the web site (url below) or by phone just mention this to get any number of wrist straps at 4/$1 with no additional postage cost.

By the way, these are genuine 3M 2209's in original sealed packaging, and they are UL certified. They include the wrist strap, paper lead with embedded conductor and resistance, and copper foil tape to attach to a convenient ground.

Send your dollar and an SASE with 55 cents postage to:

Milestone Technologies
3140 S. Peoria St. Unit K-156
Aurora CO 80014-3155

PLEASE if you need more info e-mail me direct at aa0xi@mtechnologies.com rather than take up bandwidth in the newsgroup!

For monitoring (only, no transmission), there is also a freeware DOS program out called there called PKTMON12. It automatically sorts packet traffic into separate files for each link between two different stations. It requires building a simple interface to your serial port.

I have had good results with this program - it is very easy to get to work (compared to programs to receive FAX and RTTY, for example). The only problem I have found with it is that it will lock up if I send it noise (i.e. if I don't adjust radio squelch properly).

There is a shareware program called WXMAN which works with SB card to view fax. I have used it with some success to view fax weather images on HF, but I think results are better with some of the other programs that require building a simple interface (i.e. JVFAX). The interface is really pretty simple to build. It is the same as that used by HAMCOMM, a shareware program to receive/send RTTY, CW, and other HF text modes.

I have heard of a program called RITTY (I think) that uses SB card to decode (and transmit I believe) RTTY. However, my understanding is that this is a commercial program. They have a demo but I've never tried it. Again, if you are willing to build a simple interface you can get very good results decoding RTTY with HAMCOMM.

Search for these - try the ham sites and failing that search for mention of them in DejaNews. Hope this helps, and good luck!

BTW, if you know of any good SSTV frequencies please pass these on to me (either here or in E-mail if you prefer). I have a program (JVFAX) that will decode SSTV, but have never been able to find any transmissions (perhaps I just don't know what to listen for).

There are lots of folks doing this. Check out www.tapr.org ... the
spread spectrum pages. My home link to the internet is using some
part 15 commercial equipment in the 2.4 gig range. It does 3 Mbps.
There are a number of folks on the tapr ss list that are exploring
the prospects of "rolling their own".

Americans, I fear for you and I.

Please do me a favor, pick up a book called "World Orders, Old and New", by Noam Chomsky. Thanks.

If you knew what the future was bringing, you would get a gun and baracade yourself in your house from the government. Our freedom is deeply in trouble. Greed is what's running this country(as if you havent noticed yet), and those whose lives arent "productive means" to the rich, are going to be removed or enslaved.

The government is purposely being lenient on criminals and letting them out of jail so they cause more tension in society which gives the government a reason to stomp down and cast more laws giving them more control over us. And the fear generated causes us to separate from each other more and more. The court systems have purposely been flawed, this was planned years ago. Believe it?

The plan entails severing the people using media(press, tv, radio, newspapers) and creating extreme tension between the races of which there eventually is going to be a major riot, or revolution. They know by letting criminals out on "technicalities" they will re-commit the crimes they previously had, and this will build up, the general public will become extremely fearful, and the general public allows their rights to be retracted by the government thinking that the laws that they cast will bind the criminals, which clearly will not. The laws have only one purpose, to get you to a point where you cannot defend yourself when the government wants to take direct control over your life. Where you go, what you do, when you do it, and if they can what you believe. Believe me? Please, for your sake, do....

How could you not? Look at technology, how it has skyrocketed. Now why has'nt society healed, why hasnt the government used what they know to heal those who cant heal themselves? Because its not profitable.

Are there ethics to dominating those who cannot assume a profitable life?
Should the rich man care about the poor man? DOES HE? Look at our society and there is your answer.

Those who could not excel in school, and achieve a high academic standing, are the ones the government doesnt care about. They will not be "Profitable entitys to ANYONE", so the government doesnt care about them, and quite frankly see's them as a hinderance. They bogg the

profitable machine, and are a hassle to the rich corporate leaders(who are the government)who only want to see themselves get more money than their corporate buddy next to him. But what about the guy who didnt get the college education to get the high paying job, the guy who doesnt want to hurt anyone. Couldnt they sacrafice just a little of their massive incomes to give a little more money to the lower guy on the totem pole?

I would think if they believed in GOD they would. Ethically it would be the right thing to do to give $10,000 more a year to the guy that makes $20,000 dollars a year. But that $10,000 has to come off of his $1,004,000 a year, and that would maybe cost him a vacation out of the 3 he takes a year. See what I mean about ethics, if their were some, these guys wouldnt be doing what they have been doing to the middle class.

These corporate leaders(government) quite frankly I have found don't believe in GOD, in any form such as I could see. They firmly believe that their profits make them SUPERIOR, and they should have control of the world. If you are not profitable in your life to someone, some corporation, some business, you eventually will not have a place in this world. The Corporate Structure, will have so many laws in place, that you will not be able to move without permission. Believe it? Please start. Its happening.

Population control. A highly desired element of these industry leaders. All of the post WWII wars were population control wars. Look at them, you know its true. Think about it. Korea? Viet Nam? Why?

How can the average American citizen have absolute proof that we need to be engaged in combat to protect "our interest's" (which are corporate interests, a possible threat to their profits)? We cant, and the "High Elite" don't want us to be capable of that. Shit, we wouldnt fight if we knew that it wasnt right to be in battle just for someones profitable interests. It wouldnt really be ethical, would it?

Anyways, I could go on and on, but if you want hardcore proof, read this book, it's hot off the presses, and I wouldnt be suprised if Noam Chomsky life is soon in danger.

Again, "World Orders, Old and New", by Noam Chomsky. He is a professor at MIT(Massachusettes Institute of Technology). Do yourself two favors, read this book, and be nice to someone you wanted to be mean to.

Kantronics KPC3 with Radio Shack HT htx202, all works fine, but low power. I wanted more power so I hooked it up to my Yaesu ft2400. 4 wires. Read the books. It worked, for a little while. Sent and received ok. THEN, no rec and one of my lights on the 2400 display went out. Did I short something? Now I have to receive on the modular plug. Hooked up the mic and all works fine. The tnc cannot hear off it anymore. Hooked up the tnc to the ht and all works fine. Something must have happened to the 2400, but what. How it stands now: The 2400 works for voice, send and receive, one display light out. It will xmt packet but and you can see the signal come back, and hear it, but it does not sent this data to the tnc. ALSO, in the Yaesu 2400 book, it says use the for wires, but it says nothing about how to turn off the speaker.

Did I mess up the 2400? The 2400 book said nothing about any resistors or anything. I don't know what to do.

Thanks for your help.

It depends on the channel quality, of course. For most HF channels,
4 levels, or at most 8, reach the point of diminishing returns for
FEC armored data transmissions.

>> Then move up to contextual decoding. The reason for two
>>stages is that you really cut down on the amount of data by time you get to

>
>It helps a lot if you can concentrate on the most "suspect" decisions.

That's true for data communications which is using FEC. An erasure
is much more valuable to the algorithm than a suspect bit. But for
Morse copy, there is no FEC, and erasures are much less valuable.
You may be more effective just using contextual clues to see if the
element "makes sense" rather than depending on a soft decision
decoder's flagging of suspect carrier sense. Remember, with non-
coherent Morse, you aren't even sure you are sampling during an
element interval at this point, so the soft decision isn't really
telling you anything useful.

Update on my problems!!!!!!!!!!

The Yeasu light bulb was just loose. Wow, what a relief! I thought I really shorted something.

So the only thing that remains is, I can transmit packet with it, but it does not send the rec data back to the tnc. I don't know what else to check. There are only 4 wires that need be connected: gnd, ptt, snd and rec. The radio received the signal it just does not send it out on the wire that the book says. Maybe the book is wrong? Operator headspace? I got the other 3 correct!

Thanks for any help

Yeasu FT2400 and Kantronics KPC-3 TNC

True.

>But for
>Morse copy, there is no FEC, and erasures are much less valuable.
>You may be more effective just using contextual clues to see if the
>element "makes sense" rather than depending on a soft decision
>decoder's flagging of suspect carrier sense.

Morse code is an early form of text compression using the shortest codes for the most common characters. There was an article in Wireless World "Did Morse get it right" (or a similar title) showing the effectiveness for encoding plain text in certain languages and not so effective, when encoding plain text in other languages.

Anyway, the problem with compression and in particular variable length coding is that it requires a reliable transport medium, either with a high SNR or some form of FEC. OOK Morse is a vulnerable form of variable length coding, since it is very easy to loose character synch due to a single bit failure. If you have a short sequence of dots and dashes with some suspect dots, dashes or spaces in the middle, you can start from both ends (where you had a solid copy) and scanning towards the suspect area in the middle. Playing around with the suspect elements, you can then try to determine by contextual clues, if there is an inter character space at all in the suspect area and if so, where exactly it is. This will help to reduce the possibilities in the contextual search.

>Remember, with non-
>coherent Morse, you aren't even sure you are sampling during an
>element interval at this point, so the soft decision isn't really
>telling you anything useful.

When receiving Morse code sent with an electronic keyer, it does not take a lot of characters to determine the dot rate and then rescanning

the message with the correct dot rate and only have to adjust the bit time with +/- 0.5 dot time for each character or word (depending of the habits of the operator). To effectively decode signals sent with a straight key, you need a much larger sample to determine the "fist" of the operator and then rescanning the message from the beginning.

Bob,

I don't have my service manual close by, but I believe you can reset the cpu by turning off the power then re-apply power while holding the "A=B" button. This seems to work on my 430. If it doesn't work for you, let me know and I'll dig out my manual and check it again.

I don't fully understand the question, but a few thoughts:-

The "*** CONNECTED to GB7NEM" comes from your TNC, not from the mailbox.
It is a normal TNC connected message, I don't know why you expect "***"
on the end, because, to the best of my knowledge, no TNC sends that.

When you say nothing happens, do you mean the BBS then sends nothing
else, or that you see nothing else on your screen? By that I mean that,
if someone else monitored your connect, would they see the BBS sending
your frames that your system isn't displaying?

The RLC200's original firmware is more or less TNC2 compatible. Supplied
with WinPack is a set of TNC parameters for that TNC
(TNCPARAM\RLC200.TXT) have you checked those against your own settings?

>other 3 correct!

Wait, you said in your previous message that it did work for a while,
so something must have failed. First use a scope or pair of headphones
to determine that there isn't any audio on the indicated pin of the
radio connector (open the squelch and listen for channel noise if a
handy signal source isn't available). Now open the radio and trace
back until you *do* find audio (it's in there somewhere since it still
works to the speaker). Once you find audio, you know the failure is
between that point and the pin on the back. Ordinary troubleshooting
techniques will take it from there. (I don't have a schematic for
your radio, so I can't give more detailed advice.)

Note, if you *do* find audio on the radio connector pin, then it is
obviously a faulty cable between the radio and TNC.

Do you want to do HF or VHF? If VHF, what are the others in your area doing? It won't do you any good to attempt to use something others local to you can't receive. And do you want high performance, or are you willing to accept mediocre performance to have a quick look-see? There are very cheap basic methods you can use on HF or VHF which will get you a taste of what's happening. But if you want good performance in a particular method, you may need to spend a bit more. Let me give you a quick rundown on what modes are in use.

HF:

RTTY This is the old standby. Almost all of the equipment available for HF operation supports it, or you can easily homebrew an interface for it. This method has remained the favorite of Dxers (perhaps because it has no error correction or automatic link support and is thus more dependent on chance and operator intervention). Both the Baudot and ASCII character sets are in use for amateur RTTY. Speeds in use are 45, 50, and 75 baud. Shift is typically 170 Hz.

AMTOR This is an adaptation of marine SITOR. It is falling rapidly out of favor among amateurs, but much of the available equipment will support it. It uses the Baudot character set (slightly modified). Speed is fixed at 45 baud, and shift is typically 170 Hz. Your radio needs rapid TR time to support this method.

PACTOR This is the currently most popular error controlled method used by amateurs. Most of the available equipment supports it, and it is fairly robust thanks to use of ARQ. It uses 7-bit ASCII (and can support binary transfers via bit shuffling and quoting using external software, that's clumsy and inefficient however). Speed is either 100 or 200 baud, automatically selected depending on conditions. There is built in Huffman compression, which can be useful on some text but can also cause some sorts of files to balloon in size. Some characters have special meaning to the protocol and must be "quoted" to be transmitted. Link turnaround must be manually initiated.

GTOR This is a proprietary method of Kantronics. It uses Golay coding for forward error correction. It is fairly robust and can offer good throughput under some conditions. It operates at 300 baud. It hasn't gained wide acceptance as yet, but is included in the popular KAM multimode controller.

Packet This is ordinary AX25 packet, done at 300 baud using Bell 103 tones. It doesn't work very well on HF because of propagation induced hidden terminal effects, and because of the relatively long data frames which have no FEC protection. A single channel induced bit error requires that the entire frame be repeated (it does use standard AX25 CRC error detection and ARQ repeat on error). This is very inefficient on the noisy HF channel. It remains popular, but is desparately in need of an overhaul to correct its defects.

Clover This is a proprietary protocol of HAL. It is very robust and spectrum efficient. It is extremely adaptive to prevailing channel conditions, is transparent to 8-bit binary, and offers quasi-duplex operation. It uses the powerful Reed-Solomon error correcting method as well as supporting ARQ. The basic symbol baud is 31.25 which makes it very resistant to HF multipath, but it uses a clever symbol overloading scheme with 4 carriers modulated various ways to yield an uncompressed bit per second throughput of up to 750 bps (for the 4100, 375 bps for the P-38). External user compression schemes optimized to the particular data being sent are fully supported. In the 4100, it also offers automatic transmitter power control, that's deleted in the P-38. (There is also a Clover 2000 version which supports 2000 bps uncompressed throughput, but current antiquated amateur rules forbid that in amateur HF service at present.) It automatically adapts to channel conditions, continously exchanging BER, SNR, and dispersion information with the other station to maximize optimization of channel usage. and at its most robust weak signal state it offers 62.5 bps. (We're talking *really* weak signal at this point, it is usually inaudible to the ear at this rate.) This method is very well suited to computer networking applications as well as to the more common operator chatting operation. You can transparently run a TCP/IP network application over a Clover link. The only other HF method in use which can do that is the very much inferior HF packet system.

PACTOR II This is another extremely robust advanced protocol. It is proprietary to SCS, and only their expensive PTC II controller supports it at present. This method uses cleverly adapted M-ary PSK modulations to achieve an uncompressed bps of up to 800. It uses heavy FEC and progressively less complex PSK to remain functional at very weak signal levels (under some conditions at substantially weaker levels than even Clover can support). It draws heavily on the ordinary PACTOR protocol, to which it is downwardly compatible, and suffers some of the same defects as PACTOR for transparent operation, IE some characters are special and require quoting, bit shuffling is

required for binary transfers, and manual OVERs are required to
turn the link around. It also includes built in Huffman compression,
which while often useful on text, can balloon the size of binary files.

Both of these latter two methods use powerful DSP engines to support their
advanced modulations. DSP can also be useful for the other methods, but
doesn't offer as great an advantage for them as it does here with these
more complex signal designs. As you might gather, I have chosen to use
the Clover method, mainly because of its transparency to computer networking
operation, and because it is more popular and in widerspread use due to
lower equipment cost.

On VHF+, things are different. Packet is virtually the only digital
method in use. This works much better in the VHF+ environment than
it does in the HF environment. AX25 is usually an adequate link level
protocol for VHF+ operation. Where the differences arise on VHF+ is
in the many different speeds and modulations used to convey the AX25
signals. A rough breakdown is as follows.

1200 baud This is the basic original packet method. It uses the
AFSK over FM Bell 202 tone set for half-duplex 1200 baud transmission.
This is done using ordinary voice grade FM radios. Every
available TNC supports it with a built in Bell 202 modem.
There are lots of problems with this method in today's
world where we expect much better performance, but it
continues to serve as the base level method of amateur
VHF+ packet.

1200 baud This is a more robust weak signal packet method used
PSK over SSB for some amateur satellite systems. It requires a
separate modem, and of course a SSB radio. Most of
the available TNCs, except Kantronics, will take an
add-in or external modem to support this mode. (The
Kantronics Data Engine *will* accept these external
modems.)

2400 baud This was a Kantronics method. It has virtually disappeared
AFSK over FM from amateur use.

4800 baud This is the HAPN method. It too has virtually disappeared
AFSK over FM from amateur use.

9600 baud This is the K9NG/G3RUH method of doing specially shaped
FSK over FM FSK via FM radios. It is used in moderate speed amateur
networks and for some satellite communications. It typically
doesn't work well through amateur grade PLL synthesized FM
radios, but it can work quite well with data radios which
either use direct FM of a crystal controlled oscillator or
which use IF modulation outside the PLL loop filter. Add
in modems are available for TNCs other than those made by
Kantronics (again the Data Engine will accept these modems
too). Kantronics does offer a TNC with a 9600 baud modem

integral to it.

19.2 kbaud FSK
This is direct FSK of baseband data onto a carrier. It can work well in some applications, though it isn't very spectrum efficient. This method is used on some amateur network trunks. Kantronics offers a radio designed for this application.

56 kbaud MSK
This is the WA4DSY (aka GRAPES) RF modem now available assembled and tested from PacComm. This is a medium speed user or trunk system. It works very very well in a LAN supported by a duplex repeater, and is quite good as a backbone trunk system too.

Higher speeds
There are several higher speed systems in use. Slovenian amateurs have developed 256 kb and 1.2 Mb data radios which are relatively simple and robust. And there have been numerous other high speed systems used experimentally such as those developed by Glenn Elmore, and the ethernet over microwave experiments done in Colorado and elsewhere. Use of spread spectrum techniques is also an area where new and faster systems are appearing.

The VHF+ environment is much more benign than HF. Long data frames sans FEC protection have a very good chance of making it through the channel successfully, and the hidden terminal problem, while still vexing, is not so severe (and we can nearly negate it by using duplex repeater systems). So AX25 has retained its dominance as a link level protocol. It also supports networking protocols such as TCP/IP in a transparent manner, so it hasn't hindered amateur network development. We could do better, but there hasn't been much motivation to do so. Most of our energy has been devoted to building faster systems, to networking existing systems, and to developing applications to use those systems.

Amateur applications for packet include traditional bulletin board systems, PacketCluster DX spotting systems, and APRS position tracking systems. On the faster networks, applications common to the internet also exist in some areas, even including having web pages and web browsers in use, and use of internet phone programs for digital voice. The latter *are* the exception rather than the rule, however, and most of VHF+ packet is stuck at 1200 baud and is used for keyboard chatting with other operators. There are some public service and emergency service applications of packet which are quite valuable, even at 1200 baud, but faster is better.

>effective, when encoding plain text in other languages.

Yes, Morse used the printer's typebox count to determine frequency,
but 1840s prose doesn't map terribly well to the sorts of messages
we typically send via radio. Worse, the most frequently used letters
are encoded with the least amount of transmitted information, thus
making them the least likely to be decoded correctly in noise (the
more information conveyed about a character, the more of it we can
lose without totally being unable to recover the character). That's
a ghastly decision for weak signal work.

With a uniform code, every character is encoded with the same amount
of transmitted information, so frequently used letters are as likely
to be decoded correctly as the least frequently used letters. With Morse,
the least frequently used characters are conveyed with the greatest amount
of transmitted information while the most frequently used characters are
transmitted with the least. Thus the most frequent characters are also
the ones most frequently decoded in error. Bad plan.

>Anyway, the problem with compression and in particular variable length

Sounds like "turbo" coding. :-)

You're right, scanning and rescanning is a very helpful method of extracting the most information from the signal. The Morse Code's design is *not* helpful in this regard, however. It offers no consistent built in clues to aid the process.

>straight key, you need a much larger sample to determine the "fist" of
>the operator and then rescanning the message from the beginning.

The latter can be nearly impossible with some of the ragged fists heard on the air. Uniformity of timing is essential to good weak signal extraction, and most hand sent Morse is remarkably lacking in uniformity. Even with an electronic keyer, character and word pacing can vary wildly from one letter or word to another. This really hurts the ability to extract the signal from noise. Morse sent from a keyboard buffer is much easier to process in noise than hunt and peck text, and that's better than hand sent text.

Look carefully at Table 2: E receives 144-146 and 430-440, while E3
receives 67-180 and 400-512 MHz.

It appears there is no way to get the 800 MHz band on "K" (U.S./Canada)
models, which should make Newt Gingrich happy.

Page 16 appears to be missing from the JPG images.

I checked my pages and indeed we don't have page 16
What i don't understand is that all pages i have are just like i
received from Kenwood and they are one part.
No way they could "forget" page 16, i think it's a mistake in numbering
the pages sins page 15 and 17 are one.

I ask them for it and let you know.

William

>letter-space is (00000000000) and a word-space is "longer than a
>letter-space".

Well, lets clarify this a bit. OOK has two states, call them 1 and 0,
but there is no information transmitted about the 0 state. That we are
in a 0 state has to be *inferred*. This costs us 3 db compared to a
system which transmits energy for both states orthogonally (or 6 db if
the states are transmitted antipodally) against a gaussian noise background.
So OOK has a deficit in performance versus better modulations. That holds
whether the encoding of characters is done in ASCII or Morse.

In fact some clever tests have shown that humans can be trained to understand FSK modulated Morse under weaker conditions than they can OOK modulated Morse. This isn't just a machine decoding artifact, it is universally true.

Now any encoding which uses a binary transmission medium has to depend on timing to convey more than a single 1 or 0, yes or no, mark or space statement about its condition. Morse requires information be conveyed about when timing edges occur, and what state the system transitions to at that moment. Other codes, such as Manchester, don't care what state the system is in, only that a transition has occurred at a particular time.

We can copy Morse with a sounder because we get a distinctly different sound when the sounder transitions from the 0 to the 1 state than from the sound we get when the sounder transitions from the 1 to the 0 state. The order of the "click" and the "clack" give us transition *direction*. If we were copying Manchester code by ear, all we'd need is the "click" to tell us a transition occurred. We wouldn't care which direction the transition took. This is useful because it reduces the amount of state information we *have* to recover and retain to make a decoding decision.

Uniform codes provide these transitions at intervals which can be precisely determined a priori, Morse does not. This is a major win for the uniform code in a gaussian noise environment. That's because we can tailor a perfect matched channel filter for the uniform code. We cannot do that for a variable length code like Morse. This perfect matched filter maximizes Eb/No, and hence our probability of making a correct decoding decision.

>You may have noise in the sampling instances, but the ADC usually samples
>much more frequently than the human hand sends the code. Dashes have more
>1's than dots and about the same number of trailing 0's; letter-spaces have
>more 0's than dots and dashes and word-spaces have more 0's than all the
>others. It's just a little adaptive filtering; there are known average
>dot, dash, letter-space and word-space that can be used as starting points.

The ADC *must* sample faster than the code is sent. At minimum, it must obey the Nyquist limit. Now the faster we sample, the more *noise* we sample, because noise has a gaussian distribution. During the 0 intervals, *all* we sample is noise. During the 1 intervals, we get noise plus signal in our sample. To maximize correct decoding probability we have to maximize the ratio of signal energy to noise energy, IE Eb/No. We can't do that during the 0 periods, because all we get is No/No. Thus the 0 periods don't contribute to information about the signal in a positive fashion.

Now we can attempt to use adaptive filtering on the signal, but there are several frequencies we must filter, not just the one of a uniform code. Let me illustrate this using your notation. A dot is 111111000000. That is a symmetrical signal and can be resolved to a single discrete frequency, IE a Fourier transform will show a single energy peak. We can form a matched filter around that frequency, and resolve it maximally against gaussian noise. But now we have the dash, it is 111111111111111111000000. That is *not* symmetrical, and when we

Fourier transform it, it does *not* resolve to a single frequency around which we can form a matched filter. The filter we can form will have more noise energy than the filter we formed for the dot.

You say that's Ok, the dash has more signal energy than the dot. That's true, but now lets see what happens when we mix dots and dashes. To the dot filter, the last 12 intervals of the dash look like a perfect dot. It is going to declare to the decision circuit that a dot is present. The dash filter is going to declare that a dash is present. The decision circuit is not offered a clear choice. Now lets look at the reverse case. Lets have two dots transmitted. 111111000000111111000000. The dot filter is going to declare two dots, but the dash filter is going to report a 66.67% probability of a dash being decoded, IE a somewhat corrupted dash. The decision circuit must choose, was it 2 dots, or a channel impaired dash? It has no good information on which to base a choice. This is why multiple symbol lengths pose a decoding problem.

And finally, we *cannot* form a matched filter for the space states. Any filter we form returns a uniform DUH! because there is no way to discriminate between a letter space or a word space or an intracharacter space against a channel fade or other impairment because *no* signal is being recovered. It is all the same gaussian spectrum in each case.

>The QAM-like constellation I was referring to is what you'd get after
>sending this VLC through your sample-and-hold/periodic-integrator. You
>would need to bias the decision threshold so that dashes appear above dots
>above the "zero", with the letter-spaces above the word-space, both below
>the "zero".

But you *cannot* do that. You don't have any basis on which to discriminate, you have no idea where to set a slice level, and the spaces all resolve to the same value anyway.

>It's all software and very sharp band-pass filtering. ;-)

There's a computer term which applies here. It is GIGO. Without a clear basis for decisions, you might as well flip a coin. Now you *can* form a basis for decisions if you can recover a clock. This allows you to align your samples with the various timing states of Morse, and lets you *build* a decision tree which will lead you to the correct decodings. The tree will be impaired by the reduced Eb/No because of the inability to form a single perfect matched filter, but it will work if the SNR is good enough.

Once you get past the deficits encountered by using OOK and by the inability to form a perfect matched filter, clock recovery is the *major* problem of a code like Morse as compared to a uniform code. Clock recovery, and clock *phasing* is a daunting problem with a variable length code. It can be hard enough with a uniform code buried in gaussian noise. It can be darn near

impossible for a hand sent variable length code.

Note that again this is not just a machine decoding artifact.
A human faces the same quandry trying to determine where signal
edges occur against a gaussian environment.

>Yes, signaling systems like QPSK are significantly more efficient, IF you
>have the equipment to encode and decode the signals in the first place.
>The beauty lies in the fact that you don't NEED a computer to encode or

>
>It's all a matter of perspective. Most people I know can't listen to an
>ASCII bit stream, even at slow speed, and determine what the computer is
>transmitting. ;-)

That's because they've never *tried* it. If you spent as much time
and effort conditioning the wetware to copy a slow ASCII FSK signal
as you spent conditioning the wetware to copy OOK Morse, then I
contend you'd be able to do it, and be able to do it against a
harsher gaussian noise background. Signaling and information theory
say so, and some human perceptual experiments tend to reinforce that
conclusion. Though I wouldn't choose ASCII as an ideal code against
the gaussian noise either. There are even better codes which can
be used against that.

There are basically three reasons why people don't do that.
1) Machine modes are generally sent way too fast for human decoding.
2) It never occurred to anyone to try since machines did it first.
3) And machines do it faster and with a lower BER than humans ever
could anyway, so why bother?

I believe that if all our text encodings were sent as slowly as
Morse, we would quickly abandon Morse as inferior. It is an artifact
of history that Morse came before the better codes, and that the
better codes were first used at much higher speeds via machines.
Today, there is little point to slowing the superior codes down
to speeds humans can handle because the machines to do it are
obviously faster and widely and inexpensively available. Morse
hangs on as a regulatory artifact of distant times.

First, does that flexnet page have any information on a soundcard-modem
for DOS? I didn't find any, maybe I missed it.

Second, I am very interested in the linux-soundmodem idea. I'd like to
contact people who have been using it, and see what the problems might
be, etc. I was going to look in the linux-hams list archive, but that
seems to be down. Does anyone know of a working archive of this list?

Anyone wishing to register opposition for the ARRL/AMSAT submission should send a brief e-mail message to wrc97@fcc.gov. The Subject line should say "Reference No. ISP-96-005 IWG-2A." A simple statement to this effect, "I oppose the ARRL/AMSAT opposition to the NVNG MSS flexible allocation proposal," will be included in the public record and will help to drive home the point that there is broad-based approval to well conceived 2 metere sharing proposals. It ought to be clear to the FCC the public good is poorly served by allowing hams exclusive use of these valuable
frequencies.

Please note! The proposals the League opposes are not FCC proposals, nor are
they endorsed by any other branch of the government. They are industry proposals. The League's objective is to falsely demonstrate there is broad citizen opposition to the industry proposals.

Additional arguments or evidence also is welcome. Important! Comments should
reach the FCC no later than March 4, 1997!

>with character synch.

Well, it also depends on the nature of the channel errors. If the
primary error source is similar to impulse noise with a pulse width
much less than one dot time, you have a point. But if you're facing
a gaussian noise distribution, the shorter characters suffer more
because you'll recover less energy to contrast against the noise.
And if the channel impairment is multipath fading on the order of
22 mS (common), you have yet another situation, and you can lose
whole short characters to the fade. And you might not even know
you'd lost it because letter space duration is often ill defined
in manual Morse.

>The problem with non-uniform timing with manual sent Morse is that you

>bandwidth 3 - 5 larger than what would otherwise be required for
>machine reception. The larger bandwidth OTOH, will reduce the SNR by 5
>- 7 dB.

Exactly right. I was reading a review of one of the new DSP filter
boxes last night and the reviewer was complaining that he couldn't
use the narrowest settings with a noisy signal because "the code
blurred together". That's because he was cutting off the harmonics

responsible for the element timing edges and the edges were blurring into the gaussian noise. He had to go to a setting 5x greater than the basic baud would indicate to get good copy, and that reduces SNR by -6.99 db.

With a uniform code and a known clock phase (either recovered or externally referenced) a machine could sample the center of the bit interval and not need to use a filter of 5x the basic baud, and thus wouldn't give away that -6.99 db. But even a machine can't do that with manual Morse. You have to locate those edges, and that costs you nearly 7 db in achievable SNR.

Gary

I started out on VHF packet with a KPC3 and a Standard C528A HT. A friend had used it with his Standard, and it came with an interconnect cable that plugged right into the speakermic jacks of the Standard. Now I'd like to use it with the Alinco DR610T "mobile". Rather than hook it up to the mic jack of the Alinco, which is the 1200 baud method the manual mentions, I'd like to simply plug it in the back where there are the 9600 baud jacks that are a perfect fit for the molded double plug I used with the Standard. The Alinco manual mentions that the 3.5mm jack is for data in, and the 2.5 jack is for data out, which is the reverse of the Standard configuration. Can the KPC3 work at 9600 baud with the Alinco if I simply swap the connections in the plug going into the KPC3, or would I be better off with something else? I apologize for my general ignorance of packet, which I hope to remedy by getting on it regularly, without frying the KPC3 or the Alinco in the process! Thanks. --Bill Ruth KB8USZ william.a.ruth@oberlin.edu

WHY do you ONLY want to give away 2 meters, Burtie?

Why not get all the hams to write the FCC and recommend that they give away ALL of our spectrum?

I am sure the readers of this newsgroup are already dashing off letters by the DOZEN to the FCC in response to your great message, since we all follow you like the pied piper!

Burt Fisher <burtfisher@geocities.com> whistled a happy tune like:

|>Anyone wishing to register opposition for the ARRL/AMSAT submission
|>should send a brief e-mail message to wrc97@fcc.gov. The Subject line
|>should say "Reference No. ISP-96-005 IWG-2A." A simple statement to this
|>effect, "I oppose the ARRL/AMSAT opposition to the NVNG MSS flexible
|>allocation proposal," will be included in the public record and will
|>help to drive home the point that there is broad-based approval to well
|>conceived 2 metere sharing proposals. It ought to be clear to the FCC
|>the public good is poorly served by allowing hams exclusive use of these
|>valuable
|>frequencies.

|>Please note! The proposals the League opposes are not FCC proposals, nor
|>are
|>they endorsed by any other branch of the government. They are industry
|>proposals. The League's objective is to falsely demonstrate there is
|>broad citizen opposition to the industry proposals.

|>Additional arguments or evidence also is welcome. Important! Comments
|>should
|>reach the FCC no later than March 4, 1997!

I'm a professional educator of electronics and computer service technology. I've only had my ham ticket for about a month now, but I'm learning a lot about this fascinating field. In fact, it was a few of my students that got my interest up in ham radio, and I've done what I can to promote it to my other students. I view it as a national resource... and also realize that it is fast becoming an endangered resource!

Reading these newsgroups has helped me have a better understanding of not only the technical aspects of the field, but the kind of people that are involved in it. The vast majority of the participants in these groups are extremely helpful, and willing to do anything they can to promote amateur radio... proud followers of The Amateur Code by W9EEA!

I've also learned that there are a small number of participants that prefer to use the newsgroups for their own pleasure... attempting to degrade the service and those participating in it. No doubt these types have other interesting diversions when their computers and rigs are down, such poking sticks into hornet nests to observe the reaction. I've been around long enough to know that this type of person will continue to provoke a response until they are ignored long enough. Even

the hornets learn this lesson!

Perhaps the formation of a new newsgroup, such as rec.radio.amateur.whiners-cryers is in order, so that these types can have their own little playground and stop spamming the groups that are helpful!

Also... please don't think anyone identifying himself as a "teacher" speaks for everyone in that profession. Hopefully you too have been around long enough to realize that there will always be a few dog-eared cards in the deck. Fortunately, they are easy enough to identify.

Obviously, I'm opening a path for flames by posting my opinion here... and from the childish battles I've read on these newsgroups, I certainly expect a few. I'll just ignore them. Then the flamethrowers will find another nest to poke.

My two cents...

John - N3YPR

A-Yup, this one needs to go away. A (simple?) multi frequency,
digital code device can be built yourself if your so inclined to. Why
pay much more for something you only need if your into illegal doings.

Jerry

True, but the mean value of a "0-state" is of zero energy, while the mean of a "1-state" is non-zero/above-threshold energy ((A^2)/2). I'll tackle this bit a little further on.

Getting a little philosophical, the lack of information is information in itself. Yes, I'd much prefer to use something other than OOK, where the low and high states are distinguishable, but on the transmitter side of things, transmit/no-transmit is better (in terms of over-all power consumption) for, say, a QRP set-up, than transmit/transmit/off of other modes. That is assuming all other factors are equal, which they rarely are anyhow. :-)

> In fact some clever tests have shown that humans can be trained to

Oh, no doubt about it! As a musician myself I can fully appreciate this. The human ear is quite the versatile tool when trained. Half the battle is coming in on cue after several bars of rest; "playing" the rests.

[stuff about uniform codes deleted - all very true]

> contribute to information about the signal in a positive fashion.

I think this is where our perspectives are differing somewhat; I don't think I was clear in what I was trying to get across. What I was trying to say was that the sampling rate is significantly higher (by several orders of magnitude) than the morse code symbol rate (dots, dashes and both spaces); oversampling can work wonders.

Yes, you are sampling more noise, but that noise is (usually) of zero mean relative to both OOK states. If you average the samples over a sufficiently small (so you don't kill the actual OOK signal) moving window, you'll knock out a great deal of that noise. That gets rid of the "pure" noise; after that you just pass the signal through a very tight BPF to knock out the adjacent signals, square the resulting values to get them positive and use the resulting "rectified" numbers as your bits/no-bits values based on some energy threshold. It's these bits/no-bits values that you use to generate your decision Markov chains; Neural Networks, Kalman-Bucy Filter, <insert_algorithm_here> from here on in.

[other true communications facts deleted]

> the reduced Eb/No because of the inability to form a single
> perfect matched filter, but it will work if the SNR is good
> enough.

Have to disagree with you on this one. A fair coin tells you nothing, but any bias will show up over time if your algorithm/filter is designed to accommodate the temporal variance. We already know ahead of time that we expect to see four discrete symbols evolve over time. One "coin" is dots versus dashes, the other is letter-spaces versus word spaces. Morse code symbols themselves are your clock. No one said it was going to be easy. :-)

By the way, wasn't the original question asking how to build a better algorithm for decoding morse code? We've gotten a bit side-tracked, but it's been fun. :-) Think we've scared off the original poster?

Andrew.

Come on, Burt....
Let me see ---- public service events (bike races, marathons, sporting events, Special Olympics, APRS at the real Olympics in Atlanta, etc), search and rescue communications (whether on foot, in vehicles, or in the air), coordination of communications for emergency management agencies (from city/municipal to FEMA), and what about hurricanes, tornadoes, wildfires.....

Is that enough or do you need me to waste more bandwidth trying to convince you of something the rest of us acknowledge.

Doesn't say very much about your example, does it Burt? Are you
telling us that you are such a poor teacher and such a poor example,
that you can not guide your students to the more interesting,
productive areas of ham? Please don't say there are none, you and the
rest of us know that that is an outright lie. Of course, if you truly
believe there are NO redeeming features in amature radio, then that
would prove that you are not a good teacher, or at the very least,
lack the knowledge and drive to be a "good" teacher. All that said,
I'm not stating that you are not a good teacher, like I said, it could
simply be that you are spouting bilge and nonsense for some strange
reason known only to yourself.

>It is a vast wasteland.

If your above example shows your ability to motivate our youth, could
it be possible that the same could be said of your classroom?

>Hams can not ignore.

Why should hams ignore? I, personally feel, that is one of the
problems in ham radio. We ignore TOO much. You yourself have
mentioned this. Please make up your mind on how you feel it should
be.

>No you do not. If you find ham radio interesting you will love watching
>water freeze.

You have NO room to talk, Burt. YOU are guilty of being exactly what
you accuse others of being. You are still the UTH (remember that
one), you just use internet instead of ham. I find this interaction
interesting, but it is definitely more boring than talking to someone

live, on air. If this is you idea of interesting, then maybe you'd find watching water thaw fascinating. A "typical ham" (your definition) is still a "typical ham" whether it be via radio or internet>

Re what was previously posted regarding the ARRL/AMSAT position
on this issue. I would recommend that individuals do their own
research
prior to sending the suggested response. The poster points out that:

"Please note! The proposals the League opposes are not FCC proposals,
nor are they endorsed by any other branch of the government. They are
industry proposals. The League's objective is to falsely demonstrate
there is broad citizen opposition to the industry proposals."

I would ask myself - when did industry ever propose to GIVE any new
frequencies to the Amateur community? As far as "broad citizen
opposition to the industry proposal", the Amateur Community will
generally have to be its own best advocate. We know the value of
the 2 Meter band during times of stress and emergency, the general
public is sometimes quick to forget the acts of service.

The poster also states that your "simple statement" will:

".....be included in the public record and will help to drive
home the point that there is broad-based approval to well conceived
2 Meter sharing proposals."

He appears to be asking you the amateur community to use the same
"simple statement" to support the view favored by industry. Somehow
the logic escapes me - when has the Amateur not lost out in the end
to every "well conceived sharing proposal"?

The poster then wraps up with the following:

"It ought to be clear to the FCC the public good is poorly served
by allowing hams exclusive use of these valuable frequencies."

Pay close attention to that phrase "valuable frequencies"! Obviously
they are of financial value to someone or industry would never have
come up with this proposal. This is $$$$$ speaking - NOT service to
the community, not public relations, and certainly not the voice of
a broad based citizenry.

Anyone wishing to register SUPPORT for the ARRL/AMSAT submission
should send a brief e-mail message to wrc97@fcc.gov. The Subject line
should say "Reference No. ISP-96-005 IWG-2A." A simple statement to
this
effect:

"I fully support the ARRL/AMSAT opposition to the NVNG MSS flexible allocation proposal." This might be followed by a BRIEF example of a situation wherein the Amateur Service and the Two Meter band was of value to the community in times of stress/emergency.

As noted by the posting, your view -- supporting OR dissenting -- will be included in the public record and will help to demonstrate that there is support for your side of the question. Please do your own research, and don't get caught up in the rush towards "broad-based approval" of either side!

You know the value of the Two Meter Band and you know there are other groups who would like to market a few more Garage Door Openers or some other commercial (read $$$$$ making) devices. Once the frequencies
are gone, there may not be any others to share.

Comments must arrive at the FCC prior to 04 MAR 97

Please note, I apologize for the length of this posting. I was concerned
that the language in the original note ("oppose" the "opposition") might
be construed in the wrong way and do a dis-service to the Amateur Service.

73 Dave K7HMP

You need to call MFJ and ask for a diagram of the hook up. I have a
1278b that I hooked up to a htx 202. I didn't change any resistors.
MFJ instructions are to use a radio shack isolation transformer part
number 273-1374. I can't tell you what the exact connection order is
because I cant find the plans mfj sent me, and I have the transformer
wrapped in tape. I tried other hook ups using resistors and
capacitors, but this was the only one that would work.

Wrong here. If the League alerts its members to a threat to the amateur band allocations, and the membership (and Amateur community at large) agrees, it is by no means a "false" demonstration. It demonstrates that there is, in fact, STRONG, BROAD opposition to the sharing of these band segments with other sevices, as NO method of sharing has been proposed that would not severely interefere with existing services here, especially to the amateur satellite service. I encourage all those amateurs (who have not already done so) to file their comments OPPOSING the sharing of these band segments with other services.

Thanks.

The "false" comes into the picture when the league acts "concerned".
Fact is we have lost, and will loose spectrum, since the idiots in
Newington have promoted this as a "hobby" and dropped the "service". Add
incentive licensing, contests and NTS and you have a good case to get
rid of the whole lot of 500,000! ARRL did not get concerned about
220-222, now the whole band plus 2m and 440? The ARRL stacks the deck,
no doubt, but it (ham radio) is over. I am 34 and have been in radio 24
years. I said 15 years ago, hams were becoming "bookmarks" for
commercial interest. I was right. I work in the communications business
and read industry periodicals. Just wait till you find out we will also
be loosing space on 40/75 meters! This is coming real soon.
Burt, I do not know how you could put "which president do you trust
more?"
on your page. This piece of crap, in lieu of a leader, sells everything
to highest bidder. That is why you support the idea of "sharing" and
"getting along" since Clinton has made it so. For those who read this:
RCR a commercial trade newspaper has reported the Clinton regime plans
to make $50 BILLION off of additional spectrum auctions the next 2

years. They also admit that wireless company officials went to "coffees" at the white house. Now you ask why does Burt support all this? Because by Clinton selling our spectrum, he will get more federal money to use at work along with a raise for nothing! Computers, the internet in every classroom, more education spending..get it? More utopian spending at Burt's place of work.

I do agree 90% of hams are boring and unskilled, but to get to the point, sharing the 2m band will lead to exclusive allocation and then what do you do? I will become an outlaw: guns, scanners, ham radios, cigarettes, etc.

I will see you on 144.410 no matter who "owns" it!
Chris

OTOH, forgetting the character synch problem for a moment, if the
channel has a constant bit error rate, the shorter the character code,
the less likely it will be hit by the bit error. If the most common
characters have the shortest codes (roughly true for Morse _plain_
text English), the character error rate will be lower than with
uniform codes with the same BER. This of course ignores the problem
with character synch.

Some operators have a guite distinguised way of sending certain characters, such as Ls, Qs etc., so it might be possible to fine tune the decoder :-).

The problem with non-uniform timing with manual sent Morse is that you have to get each _transition_ of the keying waveform and this requires a quite high dV/dt in presense of noise to get a reasonable timing for each dot or dash. A hight dV/dt also means that you have to get the 3rd or even the 5th harmonic of the baseband signal, thus requiring a bandwidth 3 - 5 larger than what would otherwise be required for machine reception. The larger bandwidth OTOH, will reduce the SNR by 5 - 7 dB.

1084. Q: How to get relays to switch faster?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-18 00:00:00 UTC
From: jdc3538@osfmail.isc.rit.edu
Message-ID: <5ecocf$9ha@news.isc.rit.edu>
Source record: 31457
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc

I'm tinkering with a radio for packet use that has a relay for T/R switching. The relay has a diode across it to keep the transistor that runs it from getting fried. So far so good. Every now and then there is mention of how this increases relay switching time, obviously a bad thing for packet. This leads to a few questions:

- How much of a difference in switching time is there?

- What's a faster way of snubbing the induced voltage?

A trip to my home page reveals there are many good files and programs for amateur radio operators that want to use Mac computers.

<http://www.mv.com/ipusers/wd1v/>

* Ham Radio Test Simulators - where you can go from Novice to Extra Class practicing the actual tests right on your Mac! Check out the info on the new NO CODE license or scramble your neurons and learn Morse on the Mac too!

* Macnet Roster - a virtual "Who's Who" HyperCard stack with more than 780 entries giving the names, addresses, phone numbers, of radio operators all over the world that are using Macs. Check out their projects and their passions and put a design on your Mac Radio future when you see what neat things are being done!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of the latest - much of it with FTP links so what you see is what you can get with just a click. Many of the programs listed on right there for FTPing.

* Ham Radio.FAQ - compiled on a Mac with a lot of links to great Mac FTP sites for radio, electronic engineering, and similar data.

>

Ah, yes, and if you look at the figure on page 6, the "E" has a jumper
at W301, while the "E3" does not, And in Table 4, the TX-RX Unit number
for the "E" is X57-4402-71, while the "E3" us X57-4402-73. Do the X57
indicators imply the configuration of jumpers and/or diodes, or
different firmware? Things may be more comples than just moving diodes
and cutting wires. It's confusing (probably on purpose).

>Does BMKMulty allow you to use a standard RS-232 cable or do you have to
>swap a few wires at one end or the other?

You have to cut and jumper a couple of wires on the CP1 between the connector to the outside world and the circuitry - I think they steal one of the handshake lines inbound for cw keying, and one outbound for the data toggling since you don't want to go through the uart. But I use standard cables between the modified CP-1 and the computer, via a 4 position serial switch.

Also, back when I had a CP-1,
>I found it useful to replace those trim pots with 10 Turn equivalents and gave

> that is often synonamous <sp?> with weak signals and pile-ups.
>
>73, John, NJ0M

Sounds right. I haven't tweaked mine up much - might mess with it some this winter. Actually got a hal st6000 now that works on receive, so I've been playing with that while trying to figure out why it doesn't fsk in transmit. That hears better than the CP-1 from what I've seen so far.

I got BMKMULTY primarily because it offered an upgrade path into PACTOR without major expense. I can also use it on either my mobile or base computer, without tying up a whole multimode TNC in each location. I occasionally like to do some digital work from campsites using a kantronics interface with BMKMULTY that runs on 12 vdc.

Thank you William for the post-

These are indeed correct.
The newer US versions of the radio have a different processor that
will not allow the extended coverage. No doubt a request-demand from
our wonderful government.

I have been looking for something similar, to be able to use Netscape or Mosaic thru a KISS mode TNC rather than a dialup modem. From what I have read, the missing item is an ODI driver for the KISS TNC connected to a COMM port. When this driver is loaded in the TCPIP protocol stack, the Winsock should be able to use it. I have not yet located such a driver. Has anyone else ?

Announcing NEW
Ham Radio.FAQ

This is the second generation of the original file that was
a regular USENET posting entitled

"rec.radio.amateur.misc Frequently Asked Questions"

The NEW Ham Radio.FAQ is a HyperText document that is on the
WWW and it contains 3 chapters plus hundreds of LINKS to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or
soon-to-be Hams that you know or share with them the URL to this
site:

http://www.mv.com/ipusers/wd1v

Send me an EMAIL <or packet with your Email address> if you want the
FAQ text file sent to you as an attached <120 K> file with the words
"HAM FAQ" on the subject line.

Send me a formatted disk with SASE disk mailer if you want the
FAQ text file sent to you on disk. PC or Mac are fine.

Simple: He just refers them to the following newsgroup:
news://alt.radio.pirate
Just because this guy has NEVER been involved in SkyWarn, RACES, ARES, or built his own repeater network from the ground up, he thinks these things should be left to the broadcasters, and commercial guys only! He's obviously got the knowledge, and spent some time doing some technical things (he's an extra), but he must now be bored.

>or do to fix the problem

One thing I've had problems with in the past is that my serial cable seemed to be transmitting a steady signal on 145.09. Reducing the number of connectors in my serial cables solved some of the problem, wrapping exposed connections in electrical tape helped a bit too.

The interferance may be coming from the computer itself. The best solution would be to get a nice FCC approved case, but that can get expensive and takes plenty of time to install. Some things you might want to try- making sure all the screws for the case cover are in place, making sure all the interface card slots are covered, also cut up some pop cans and cover the drive bay openings in your case. Those cute little plastic cover doesn't really do much.

Another prime candidate is the monitor. If that's the problem, there isn't a whole lot that can be done. I've heard of people building a little monitor house out of pop cans, but that seems a bit extreme to me.

And finally, make sure you're using good, high-quality sheilded peripheral cables. In an RF environment, it's an investment you won't regret.

Good Luck!

Hi Mike;
If your PC cabinet is not FCC Class B certified or better, there may
be nothing you can do to help. If that's not the problem, you're going to
need alot of snap-on ferrite to tame it.

>receives 67-180 and 400-512 MHz.
Which is *exactly* my point: the receive ranges differ, yet the diode-matrix (D302-D308, labeled 'Destination diode' in table 2) is exactly the same. These diodes tell the unit how to behave. Now if the E and E3 units have the same diodes, how can they behave differently?

Note that I feel the documents contain a wealth of information,
I was just hoping to keep anybody from opening up his/her handheld and moving diodes, only to find out there is an error in this table 2. The TH79 is to precious for that.

> It appears there is no way to get the 800 MHz band on "K" (U.S./Canada)
> models, which should make Newt Gingrich happy.
Still, I see TH79A's advertised WITH 800 MHz in various newsgroups. As I understand it the older units can receive 800, but the newer ones can not. I somewhere read in an article that you can see this from the serial number:
===If your serial number is 603XXX or higher, that is all you will get. The
===TH-79A that I have posted is 602XXX
I cannot find the original article though- you'll have to search the net for it.
There may be a NOSPAM. in front of my E-mail address.
It is there to fool machines, not people.

Greetings:

With the demise of A.E.A., I understand that getting the most recent upgrade Eprom for my PK232MBX might be somewhat difficult. I have one of those older products in which I had to install a daughter board in order to impliment the mailbox function. I believe that my most recent upgrade was dated 1991 or 92. But I had always contact the factory for those chips because they were never carried by the dealers up here.

Would anyone advise me if there might be an upgrade available for sale at a retailer, even in the US?

As an alternative, I have been informed that the QRZ.com CD ROM appears to have the relavent information in order to have a set burned. Has anyone tried this approach at all?

I would be grateful for any advice.

I would say 30% of all hams are active and 10% of those are involved in contests. Those 10% walk all over the rest in their piggish ways of hogging the band.

You are right, I should not use the word "all" as you suggested.

And what percentage of hams take part in the above?
And of those that do, ham communication uses 400000 words when 10 will
do. Hams are horribly inefficent voice communicators.

Is that what it thinks it tells you. When I demonstrate ham radio I make no editorial comment. I offer extre credit for it. If I leave the radio on the comment I get is, "you do not talk to those losers do you." Ham radio speaks for itself. Not even Jesus Christ could convince our youth to get on the air with the current crop of old white fat farts.

If you want to talk direct to the student that has no use for ham radio his address is on my WWW site. See him, he is the #1 student in the school with a perfect SAT verbal score. And he knows the score on ham radio.

Does BMKMulty allow you to use a standard RS-232 cable or do you have to
swap a few wires at one end or the other? Also, back when I had a CP-1,
I found it useful to replace those trim pots with 10 Turn equivalents and gave
it a tweak every now and then. It would dig out signals my PK-232 had trouble
with every time. Got my first 225 countries using one on RTTY, then used it
as an external modem with the PK-232 until I got my DSP-599zx. Now the
599zx gives the PK-232 a DSP front end in the form of the RTTY Remodulator
feature. Admittedly, I'm only active on RTTY, but then I like to chase DX and
that is often synonamous <sp?> with weak signals and pile-ups.

I recently read some of the mail from N3HAU, N3GHE,and N1MYT
regarding a desire to get/find/build NII band digital equipment.
Please add my name to the list. I'm aware of some Part 15 'high
power' gear like Cylink's, but that's too pricey for ham use, and
really designed for pt-pt T1 like links. Is anyone else aware of
5 GHz gear that might be used in a multiple access scheme?

I'd be interested in joining a thread on this topic.

Thanks,

Steve K2PBO

Hi there!

If this question has been answered before, I apologize.

A number of us are attempting to construct a TNOS system using
some old 3B2 UNIX machines that were essentially donated to us.

My question for all of you is....
Has anybody been successful in getting TNOS to compile and execute on
any of the following AT&T machines: 3B2/310, 3B2/400, 3B2/600, or
3B2/1000?

If so, and if you would be willing to correspond via e-mail please let
me
know at wm9c@dave-world.net.

Since I am a traveling broadcast engineer, my time at the office is
sometimes
rare, therefore, I would prefer one-on-one contact via e-mail.

Thanks in advance for your help!!!!

That is, indeed, helpful information. Thanks. Any idea at what low
temperature (storage, not operating) there begins to be a permanent
reduction in capacity?

Before this thread get's any further out of hand, I have a couple of
questions:

First of all, this clown is just looking for attention and enjoy's pushing
everyones buttons. He is looking for a response from a large group of
people, and he got it! He's no better than a jammer on your local repeater;
the more you respond to his drivel, the more he enjoy's it. If he is just
ignored, he will eventually go away. Don't give him the satisfaction of a
response, he has shown that he doesn't really care about the issues, he
just like to push your buttons!
Second, he obviously was interested in Amateur Radio at one time, since he
is an Extra Class, and continues to use his call sign in his sig at the end
of every message. I really wonder what his daughter, KA1VBQ thinks about
Amateur Radio? Does he really hate Amateur Radio that much? I don't think
so...His web page has several references, links, etc to Amateur Radio. He
even has some quotes paying homage to CW. Let's see, photo's of him and his
daughter with their call signs prominently displayed, callsign search,
links to Ham Radio info, and obviously very proud to be an Amateur Radio
Operator! At least that's what it looks like from this end!
So Burt, what's the real story? Are you AND your daughter going to give up
your calls? Are you going to continue this rediculous thread? If you feel
such hatred towards the hobby, why don't you show it on your web page? I
look forward to your response and hope you can quit playing this silly game
of yours.

OK, got me on that one. :> I have NO idea why I spelled it that way.
If you kept any of my previous posts (YES, I realize you get way too
many messages to do so), then you'd see that I usually (if not nearly
always) spell it correctly.
>
>

>UTH?

I thought you would remember that one, Ultimate Typical Ham.

>Nothing is more boring than that. But I will be glad to meet you OR
>ANYONE on the air, if you have the guts.

I have seen you post that comment before. It makes absolutely NO
sense! "If I have the guts"??? I am confused as to your meaning.
All kidding aside, my first impression is that you actually do have
some serious problems. Do you so delusional as to believe that you
could harm me by merely talking to me? I have the "guts" to talk to
any human being in this world. Would your conversation be so inane
that I would die of boredom? I had always imagined it would be an
interesting conversation. Please explain this "guts" idea. I am
willing to bet I am not the only one with this question.

Hello ALL

TPK Version 1.83 as an upgrade to version 1.82 is now available.
Where you may ask ???? Point your web browser to

http://www.acay.com.au/~vk2yx/tpk.html

I gather the upgrade allows for MD2D password support and you can now
run TPK successfully in Win95....

Don't forget, the latest version of winpack (Ver 6.2) can also be
downloaded from

http://www.acay.com.au/~vk2yx/winpack.html

and if you want to bookmark a reference page, try

http://www.acay.com.au/~vk2yx/software.html

Cheers & Enjoy !!!

Pete..vk2yx

Thanks 73 Bill N2CQR

1130. Help! APRS with MFJ-1274

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-19 00:00:00 UTC
From: clarke@aztec.asu.edu
Message-ID: <5edhmh$e06@news.asu.edu>
Source record: 31484

Is anybody out there using APRS with an MFJ-1274 on VHF successfully?

I need to "borrow" your INIT file. For some reason, the file INITTAPR.TNC, which comes with the program, does not do the trick. The map comes up, I can set it up to send okay; but the program won't receive anything but gibberish. I've tried the obvious stuff; but some little command isn't right. Help!!!!!

Thanks in advance for any assistance.

1131. Re: Q: How to get relays to switch faster?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-19 00:00:00 UTC
From: djch@rivers.dra.hmg.gb
Message-ID: <DJCH.97Feb19112518@tamar.dra.hmg.gb>
Source record: 31485
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc

>- How much of a difference in switching time is there?

On a relay which pulls in in say 10ms, you might see drop out of 35 ms with a diode.

>- What's a faster way of snubbing the induced voltage?

There is a fixed amount of stored energy in the relay coil (1/2*L*I^2). This has to be dissipated. If you limit the voltage to .7V (with the diode), then the current is also small (set by the relay coil resistance), so the energy takes a long time to go.

The fix is to add a zener or similar in series with the diode. I've used a 15v zener, which improved the drop out time to ~12 ms. The drive transistor must be able to take the higher voltage (in this case 15+Vcc, but allow a good margin...). As you go to higher voltages, the time improvement gets less.

(An alternative, which I've not tested, is to energise the relay with its full voltage, and then drop the voltage across the relay to just above hold in point. This would reduce the stored energy, and hence the drop out time. It may also save power)

Given that some of the small relays now quote times < 5ms, relay switching is not to be ignored for packet. I get TXD=50ms to work fine for 1200 baud on a relay switched rig on 2m, and the relay isn't the limiting factor. The ARRL handbook has sequencers for T/R switching, you need to be certain that the various events happen in the right order :-).

1133. problem with EASILOG software - please help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-19 00:00:00 UTC
From: ceeam6@cee.hw.ac.uk
Message-ID: <E5upGu.Fp3@cee.hw.ac.uk>
Source record: 31487

Can anyone provide me with a solution to the following problem:

My dad uses Easilog V3.09 to keep his log book stored on the hard drive of his computer (the computer is a very old IBM compatible XT model) but wishes to change computer to a more modern PC. He has a friend who can convert the LOG file from his 5" disk to the required 3" disk.
The problem is, the .LOG file is too large to store on a floppy disk, and consequently cannot be copied from the hard drive to disk in order to transfer the data. Neither he nor myself know much about the software or computer, so can someone tell me if there is a way to get round this, short of having to type all the entries again on a new PC?

If replying to this, posting is OK, but please e-mail me if possible at ceeam6@cee.hw.ac.uk

Thanks.

Well you have the ability to laugh at your self and admit a minor error.
Are you sure you are a ham?

Ham radio defined:

There's just so much more in the world to catch their
eye than a bunch of farts who try to maintain their heirarchy in a
pseudo
secret society, refusing with a vengeance to pass the baton, for fear of
the
tiniest little detail of what's theirs being changed. Even if the change
is
necessary and beneficial to the hobby.

> I have seen you post that comment before. It makes absolutely NO
> sense! "If I have the guts"??? I am confused as to your meaning.

Hams are so gutless that none will meet me on the air to discuss my so
called outrageous views. It is not like I can hit them on the air.

> All kidding aside, my first impression is that you actually do have
> some serious problems. Do you so delusional as to believe that you
> could harm me by merely talking to me?

Maybe not you but most hams I could make look damn silly on the air, not
because I am smarter but I have the facts on my side.

I have the "guts" to talk to
> any human being in this world. Would your conversation be so inane
> that I would die of boredom?

Far less than a TYPICAL ham contact.

I had always imagined it would be an
> interesting conversation. Please explain this "guts" idea. I am

Hey guys,

I have been able to use trumpet winsock/pipe.com packet driver/Jnos
combination. I have a http and irc servers on line at present time.
The Jnos just routes the ip packets thru the driver/winsock. Works
pretty slick.

I believe the pipe.com package can be found at the popular packet FTP
sites.

Good luck!!

From: dstone@bnr.ca
Message-ID: <5efc9o$99j@nrtphba6.bnr.ca>
Source record: 31495

I would like to replace my PK232MBX with a newer multimode
controller.

Specifically, I am interested in PACTOR. But I am also
interested in RTTY and AMTOR.

I have been considering the KAM and Paccomm controllers,
but I am open to all suggestions for a new controller.

I am looking for: 1. Good front-end filtering.
2. Full Pactor I support.
3. RTTY support.

I don really care about multi-radio support, packet, etc.

The HAL controller sounds interesting too (Clover and more)
- any comments on that?

I'm open to all opinions.

Tnx in Advance

I guess that's one answer Mike (Neal..of Salem Oregon) if you
can't figure out the question... make a dumb remark..Sort of like Burt.

Max,
And as to the original question, if you mean a ferrite core, that's
certainly one thing, also make certain your grounds really are grounds
done with braid, not wire, and to a *real* ground. Check your VSWR.
If that's really high correct it it can cause problems with RF in places
you don't want it in a shack.
73, and ignore the Burts and Mikes of the world.

1147. PK-232 HELP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-19 00:00:00 UTC
From: Trace Klassen <ve7ggt@bc.sympatico.ca>
Message-ID: <330BA30C.24D@bc.sympatico.ca>
Source record: 31501

I just bought a PK-232 used of course, and when I tested the unit whith just a 12 volt source..all looked fine and the front panel lights did just as they should, ending with just the Baudot lite on. Upon connecting it to my computer however using a 25 to 9 pin adapter has caused only the 4 lites clustered at the left side of the panel, to come on and stay on. The program Pc Pakratt 5.1 or Yapp cannot communicate with it. What did I do? I have just finished using the same RS-232 cable to test out a PK-88 and worked perfectly. Any suggestions? And how much is this going to cost me? hihi. Also is AEA out of buisness? If not does anyone have an updated phone number for them? Many thanks for your help.

Burt, Burt, Burt....

You were spreading your nonsense on the DX Packet Cluster for years,
I see you have decided to go international in scope.

Burt, why do you bother with us Amateurs? Your only purpose in
life seems to be stirring the pot -- doing whatever you can to get
people upset. Do you enjoy the attention? Or does the attention
your nonsense generates somehow makes you feel like
a bigger and better man? You must be in your glory.

Do you view yourself as the omnipotent and ever-present "Q" of
amateur radio? Burt, what have YOU ever contributed to the
advancement of amateur radio?

What is really scary is that you profess to be a teacher.

Why don't you just burn your license, and let us continue bumbling
along without your devine intervention. You have never had anything
good to say about amateur radio, nothing to contribute of worth,
and probably never will.

Hello Colin, at this moment an "integrated network system" under Windows =
95 is an utopia... It hasn't enough network capabilities to accomplish =
this work.

Although there exists KISS network drivers (EtherAX25) this is a =
"packet-driver" and because of lack of packet driver support in Windows =
95 TCP/IP stack, it cannot be used. You will have to use another stack =
(like Trumpet's one) but it is much more limited about network =
capabilities.

But you're lucky, work is being done in this field, you can see on =
<http://www.zynet.co.uk/dajd/> for more information.

Nicely spotted Bob!
As the green wire is in series with D308, cutting the wire equals removing
D308. That leaves us with an identical diode-matrix for the E2 and the E3,
which have different transmit ranges.....

In reality it was tested that the difference between E2 and E3 is in diode
D304: with D304 it is an E2, without it an E3 (which is equal to E9).

Sigh.... Am I suffering from dyslexia or what is going on here?....

There may be a NOSPAM. in front of my E-mail address.
It is there to fool machines, not people.

I'm glad you said this Burt. The Boston Marathon will be running
on April 21st. We will need additional volunteers. I will be part
of a group using APRS software to keep track of emergency
vehicles. I believe this is a school holiday, so you should be free.

Since you are a teacher of electronics, you should be able to
throw together a tracker if you want to help even more. Simply
interface a GPS unit supplying an NMEA sentence to a TNC
of your choice. Transmit on 145.79 (you can use that 2M
equipment in your closet) . The Shareware is downloadable
from various web sites.

If you don't have, or can't build, a GPS unit, just keep the
serial interface of the TNC free and we can program it with
a laptop.

Maybe we can even put your moped to work!

Anyway, Thanks for volunteering!
73,

Steve

I have heard races covered by ham radio. CBers do better.
Hams are horribly inefficent blabber mouths but I bet your group in
the Boston area actually does a lot of good.

> Maybe we can even put your moped to work!

Now that I would be interested in.

I don't agree with Burt's position, Bruce, but I haven't seen any engineering study which would indicate that the SS signals of the LEOs would adversely impact amateur operations. Frankly, I think their signals would have negligible impact on most amateur operations, including most amateur satellite operations. There might be some impact on traditional EME operations due to the slightly raised noise floor, but that's a very tiny part of amateur activity on these bands.

The real problem is the other way, with the relatively high power narrowband amateur operations causing interference to the LEO's terrestrial users. Due to the near-far effect, nearby amateur operators would overwhelm the SS coding gain and cause interference to the receivers of terrestrial users of the LEO services. That's where the danger to amateur radio lies in this proposal.

Once they have the camel's nose in the tent, and have established an economic interest in the spectrum with a large user base, the interference to their operations by amateurs would serve as an excuse for them to go back and request exclusive access to the spectrum, IE kick the amateurs out.

Of course if amateurs also adopted SS systems, and practiced proper power control (required by amateur regulations, but ignored in amateur practice), there would be negligible interference in either direction. But amateurs appear unlikely to do that voluntarily, so conflict would

be inevitable. And amateurs don't wield either the economic or political power to prevail in such a conflict.

We may win this time, and I've dutifully filed comments supporting amateur radio, but ultimately we can't continue to warehouse spectrum. The pressure to effectively utilize the spectrum will continue to mount, and unless *we* start using it effectively, others ultimately will.

This is deadly serious. The FCC has made it very plain that they will no longer condone warehousing of spectrum. They are in the process of forcing broadcast to give up the spectrum it has warehoused. Congress has mandated that warehoused military spectrum be released. And that leaves amateur radio as the only major warehouser of spectrum left untouched. That can't last long.

Even Better Burt! Since APRS is digital (but you knew that) you need
not hear any of that horribly inefficent blabber. Just objects on a computer
screen.

BTW, As a former police dispatcher and PO (I even worked in Yarmouth,
hey, maybe I arrested you!) I understand your comments about communication.
But it's easy to critisize from the armchair, isn't it? I have been in radio
communication situations in which life depended upon good skills. Since
a lot of that experience was on the Cape, maybe it was a life of someone you
knew. I don't take this stuff lightly.

I still have a cottage in Dennisport BTW (off Old Wharf Rd.) I even have a
weather station there you could monitor if you were on APRS.

Steve

I have yet to be arrested. You sound like a very competent person.
Yes it is easy for me to bitch but I have paid dues over the years.
Once we could not get hams to help out at a Beach Boys concert at Otis
so my daughter, who was 8 at the time (KA1VBQ) was paired with an adult
Red Cross worker and she did fine.

> I still have a cottage in Dennisport BTW (off Old Wharf Rd.) I even have a

Burt, Just what are you doing to make ham radio more interesting to the young folks. What are you doing to bring more young folks into the hobby and keep them there??

It is real easy to sit back and spout a lot of hogwash about how boring, and how stupid and all of the rest of the blah blah blah that I see comming from you.

Have you started to put together a high speed packet network, at a speed high enough to use the internet browsers on? If computers interest the kids, Add computers to the radio, only do it at a speed that will hold their interest. If you come to Dayton this year look me up. The Consolidated Electronics Booth as I work for them and get stuck there for the three days. I will introduce you to a friend of mine, in fact several. One started the 19k2 network around here on 440 several years ago. He and I along with hams around the country are trying to get 900 megs off the ground with spread spectrum. All to get more speed so that ham radio can compete with the internet. Another friend is a scout leader, Their class this time around has over 40 students, all looking for that ticket as he has made ham radio interesting to the scouts by arrainging field day out at the scout camp. He has set up a satellite station to work the birds with the boys right there.

Ponder those things Burt, You claim to be an educator, yet you cut, slice and condem rather than teach and enhance. I have kept my silence for a long time now and read what you have said. Perhaps I should continue to keep it, but I feel that someone has to point the truth out to you as you seem to be oblivious of it. There are many of us out here trying to put the ham back in ham radio and make it fun again, both for us and the young folks. Please quit lumping all hams in one heap and cutting us down. You are the one that gives ham radio a bad name to the non hams that read the news groups that you post your tirades to.

Fred ke8tq ke8tq@n8acv.#day.oh.usa.noam

Come to Dayton this year and stop at the TAPR booth to say hello......

1180. ** Fast Cash **

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-20 00:00:00 UTC
From: Chris Lambert <azure@starnetinc.com>
Message-ID: <330D270D.73C3@starnetinc.com>
Source record: 31534

The internet has grown tremendously. It doubles in size every 4 months.
You see the make money fast posts and more. THAT'S BECAUSE IT WORKS.

I didn't believe these posts myself until I tried it. It only cost me 5
dollars. So I went ahead and invested my money and posted. Everyone
was
calling it a scam, but there are so many users from AOL, Netcom, etc.
worldwide, that they will join and make it work for you just like it
worked for me.

There are thousands of new users signing on every day looking to get in
on
what you now have a chance to become!

After I invested my $5, a few weeks went by and I started to see the
money
roll in. Not much at first, only a few hundered dollars. But by the
time
5 weeks went by I had made 50,000 dollars, and it was all legal.

If you want a piece of this action just follow these three steps:

Step One: Invest your $5 by writing your name and address on 5 seperate
sheets of paper along with the words "Please add me to your mailing
list."
Include a 1 dollar bill in each letter and mail them by standard mail to
the following five addresses

1)Chris Lambert
806 2C Panorama Dr.
Palatine, IL 60067

2)M.Randon
15 Harvey St.
Hamilton, Ontario
Canada L8L2L9

3)S.Brockbark
2488 Page Road
Gloucester, Ontario
Canada K1W1H2

4)I.McRae
PO Box 58002
Orleans, Ontario
Canada K1C7H4

5)M.Wurzburg
2555 Virginia St. #206
Berkeley, CA 94709

Step Two: Now remove the top name from the list and move the other names
up. #5 becomes #4, #4 becomes #3, and so on. Now put your name and address as the 5th on the list.

Step Three: Post the new article (the one with your name on it) to at least 250 newsgroups. There are over 19,000 at any given time. Remember,
the more groups you post to, the more money you will recieve.

That's all there is. Now just sit back and watch the money roll in. You
should start to see profit in 7-14 days. Remember, the internet is still
young and growing everyday...there is no way you can loose...unless you don't try.

Why it works:
The reason is that this program is a canadian founded idea. We have an even larger audience to subject to this idea in the U.S., making this even
bigger and better than the smaller organizations you'll see.

Pretty simple, huh? But believe me, IT WORKS. There are 8 million people
on the internet everyday. So, my friend, read and follow these simple instructions and play fair!!

That's the key to large money returns.
By the way, if you decide to try to decieve people by posting the messages
with your name on the list and not sending the bucks to the people already
included, you wont get that much money in return. I know somebody who did
this and they got only about 150.00 in 2 months. Then he sent the 5 one dollar bills and in 4-5 weeks he had over 10,000.00

TRY IT...YOU'LL BE GLAD YOU DID!!!

Here's how it works:
Out of every 250 posts, I got back 5 responses. Yes, that's right, only 5. That's 5 dollars in cash. Now each person who sent you one dollar makes 250 additional posts with your name at #4. 1000 postings. On average 50 people will send you $1 with your name at #4. Each of these 50
will make another 250 postings with your name at #3, bringing you an average of 500 dollars, and so on.

THIS WORKS AND IT'S COMPLETELY LEGAL.

Could somebody please post Burt Fisher's home address and telephone number on these newsgroups he keeps crossposting to so we can call him (like maybe when I'm reading the news at 2:00 A.M.) and tell him what we think of his abusive drivel and/or mail him dead rodents and such?

I read somewhere about some guy being a public pain in the ass and being subscribed to like 300 "bill me later" subscriptions to everything from porn magazines to Forbes. Surely somebody out there has a similarly wonderful idea about how to deal with Butt Fisher. If he wants to make himself a public figure, then we can treat him as such, you know posting details about his formerly private life, what kind of undergarments his wife wears, etc. I'd suggest to Butt Fisher that life as a private citizen is a little nicer than life as a public figure. I think a good argument can be made that his repeated controversial postings on USENET already make him a public figure. Thoughts?

Some people could constantly mail bomb his account until his ISP cuts him off. Of course, he could switch to another ISP, and then the mail bombing might start again. However, I'm not recommending such a thing....

But..., its real easy to set up a cron jobs under unix to send it a huge 100k message every five minutes. If 50 people started doing that ... well, you get the pictures.

1185. Looking for Lg volume of radio-modems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-21 00:00:00 UTC
From: Galaxy Scientific <galavi2@acy.digex.net>
Message-ID: <01bc201c$c46110c0$0de9dd26@aviation.galaxyscientific.com>
Source record: 31410
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I am looking for a radio modem- actually a *lot* of radio-modems-- about 100,000 of them. While I relize that what I'm looking for is somewhat different than your typical ham packet setup, it is related, and I'm hoping that some readers of this group might know of, or even be, a potential source for this device.

I'd like to emphasize that this is a real-live, large order- 100,000 - 500,000 units over a few years, with a bare minimum initial order of 10,000 units.

Preliminary specifications are below.

Any information would be greatly appreciated.

Ted Grant
tedgrant@earthlink.net

Description: Radio-modem, in OEM-board type format,
including RF section.

Data Rate: 2400 baud minimum
Modulation: negotiable
Frequency: 450 - 470 MHz (multiple frequency, 25 kHz channels)
Deviation: +/- 4.5 kHz
Range: 16 mi with line of sight,
Note: Antenna to be used will be something like a quarter wave dipole, but mounting restrictions mean SWR and effective output will less than ideal.

RECEIVER
Sensitivity: -110 dBm

TRANSMITTER
Transmit Power: 5 W [nominal. Other power OK if range requirements met]

In case you missed the number of birds...
From Edupage:

TELEDESIC LOOKS AT SCALING BACK
Teledesic Corp., the high-profile, $9-billion satellite communications project backed by cellular magnate Craig McCaw and computer mogul Bill Gates, is exploring options to scale back its 840-satellite system, beginning initially with just 288 "birds." The satellites will occupy a low-Earth orbit, 400-700 miles above the Earth, circling in 12 orbital planes or "rings," with 24 satellites in each ring. A spokesman for Teledesic says the company "has not altered" its original plan, but may start off with a more modest arrangement. (Wall Street Journal 19 Feb 97)

Hi!

I would like to know how to connect a G3RUH 9k6 modem to a
DRSI-card type 1 or 2 (1k2 and serial, and two 1k2 modems).
What is needed? How to do with the clock? Etc...

This is true. You can't see a thing on his web site unless you let him execute Media Player on your machine. I've got a problem just allowing executables being sent to, and run on my machine to suit someone elses whim. With this guy's attitude, who knows what you'd end up with.

> 73, John, NJ0M

A Class B certified case can be helpful, but it is no magic cureall. The
Class
B limits are loose enough that you can still suffer interference. The real
solution
is to use good VHF shielding practice on the PC *yourself*. In other words,
things
like sanding paint from mating surfaces so that they achieve a good
electrical bond,
using a screw every 5 cm along each seam in the case to insure a good RF
tight
bond, using copper foil to cover non-metallic openings, and use of ferrites
on
external cables (which should be *shielded* cables with connectors using
metal
hoods).

The monitor is often the most serious culprit. Use of copper foil tape on
the cabinet
can improve shielding sufficiently to reduce the noise to a tolerable
level. Internal
modifications to the monitor can also reduce noise, but that should
probably be
considered a last resort.

The PK232 uses the DB25 in a non-standard manner. It uses some of the
pins to drive a printer. You can't just use standard cables with it. Try
making
up a cable which only uses pins 2,3, and 7. If you haven't blown something,
that should work.

Hi Butch,

The only one that still has parts for this 20+ year old radio is YAESU USA !! They still work on this model radio everyday !!! AND YES THEY STILL STOCK MOST PARTS !!

If you send the FT-ONE to a dealer for service.. Chances are a radio of this age is usually forwarded from the dealer on to Yaesu for service anyway adding to the service time. As for reasonable fees... When very few people service this and old radio like this you will have to pay a little more.

Then again... You can always sell it and pick-up a new FT-840 HF rig for around $750...

FYI... Kenwood no longer offers factory service for amateur products... So you have to send your (new or old) Kenwood radio's to a separate company for repair.

I just go my FT2400H back from Yaesu and I thought there service was
great and the bill was less than I figured it would be. I wouldn't
hesitate to send any Yaesu I have to them for repairs.

Dear Friend,
Five minutes and five dollars can change your life!!!THIS IS
THE FAIREST, MOST HONEST WAY I KNOW TO SHARE THE WEALTH! Would you
like to make thousands of dollars, quickly, legally, with NOCATCH?
Then keep reading..... please take five minutes to read thisarticle;
it will change your life, just like it did mine. It's true! You can
make up to, or over, $50,000.00 in 4 - 6 weeks; maybe sooner! I SWEAR
I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're interested,
keep reading; if you're not, I apologize forwasting your time.

Here we go. A little while back, I was browsing through these
newsgroups, just like you are now, and came across an article similar
to this that said you could make thousands of dollars in weeks, with
only an initial investment of $5.00!! So, I thought, "Yeah, right,
must be a scam", but, I was curious, like most of us are, and kept
reading. Anyway, it said that you send $1.00 to each of the five names
and addresses stated in the article. You then place your own name and
address in the article at the bottom of the list at #5, and post the
article in at least 200 newsgroups, (there are thousands). No catch,
that was it! So after thinking it over, talking to a few people first,
I tried it.I figured what have I got to lose except for 5 stamps, and
$5.00, right? Well, guess what....within 7 days, I started getting
money in the mail! I was shocked! I still figured it would end soon,
and didn't give it another thought. But then money kept coming in ,
tripling in size and multipying by 10 - 20 times the amount that I got
the first week! In my first week I made about 20 - 30 dollars. But,
by the end of the second week, I had made a total of over $1000.00!!!!
In the third week, I had over $10,000.00, and its still growing.
This is my fourth week, and I've made about $42,000.00 TOTAL, and the
money is still coming in........Let me tell you how this works, and
most importantly, WHY it works, also, make sure you print a copy of
the article NOW, so you get the information off of it, and begin
making money.The process is very simple, and it consists of 3 EASY
steps:

STEP 1: Get 5 separate pieces of paper and write the following on
each sheet of paper...."PLEASE PUT ME ON YOUR MAILING LIST", and then
write your NAME AND ADDRESS. Get five $1.00 bills and place ONE
inside each piece of paper that you just wrote on. Fold each paper so
the bill will not be seen in the envelope, (otherwise, nosey people
who like to steal envelopes with money in it won't get yours). Put
one paper inside each envelope, and seal it. Do the same for all
five. You should now have 5 envelopes, sealed, EACH with a piece of
paper AND a $1.00 bill, stuffed inside of the paper. Make sure those

words that were stated above, are written on each paper. What you are doing is creating a service; this is PERFECTLY LEGAL. Now then, mail the 5 envelopes, with the paper and $1.00 bill in each, to the following 5 addresses:

1. D. Ellis, 8301 W. 92nd St., Overland Park, KS 662122.

2. J. Krakowiak , 1112 W. Broadway #1, Anaheim, Ca 928053.

3. J. Sides, Lamar Box 1, South Plains College, 1401 S. College Ave.,Levelland, TX 79336

4. Areg Mkrian, 15 Alma Ave. Belmont, MA 02178-4404

5. A Karns, 4000 NW 53rd, Oklahoma City, OK, 73112

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up, (5 becoming 4, 4 becoming 3, etc.), and put YOURNAME as number 5 on the list. You can slightly alter this article ifyou need to; editing what you need to edit.

STEP 3: Post your amended article, (with your name at #5), to at least 200 newsgroups, (There are close to 19,000 of them). HOW TO DO THIS:If you are using Netscape 3.0, do EXACTLY the following:
1) Click on any newsgroup, like normal, THEN click on 'TO NEWS',which as on the far left when you're in the newsgroup page. This will bring up a box to type a message in.
2) Leave the newsgroup box like it is. CHANGE the subject box to something flashy, like, "NEED CASH $$$ READ HERE $$$" or "FAST CASH"!!
3) Tab once, and you should be ready to type. Now, re-type, (onlyonce), this WHOLE ARTICLE WORD FOR WORD, except to insert your name at#5, and to remove #1 off the list; plus any other small changes youthink you need to make. Keep most of it the same!!
4) When you're done typing the WHOLE article, click on FILE in THISBOX, right above send, not where it says Netscape News On The FirstBox. Click on SAVE AS when you're under FILE. Save your article as a text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO THIS. Once saved, move on to number 5 below.
5) If you still have all of your text, send, or post, to this news group, now, by just clicking send; which is located below FILE, and right above Cc:.
6) Here's where you're going to post all 200. OK, click on any newsgroup, then click on 'TO NEWS', again, in the top left corner. Leave theNEWSGROUPS BOX alone. Again, put a flashy subject title in the SUBJECT BOX. Hit TAB once you're in the body of the message, and then click on ATTACHMENTS, which is below the SUBJECT BOX. You will get another box to come up. Click on ATTACH FILE, then find YOUR file that you saved; click once on the file, and then click 'OPEN'. Now click on OK. If you did this right, you should be able to see your file name in the attachments box, and it will be shaded green.If you use IE EXPLORER, it's just as easy......HOLDING DOWN THE LEFT BUTTON, HIGHLIGHT THIS ARTICLE. THEN PRINT THIS ARTICLE FOR YOURRECORDS TO

HAVE THE NAMES OF THOSE YOU WILL BE SENDING $1.00 TO. NEXT, GO TO THE NEWSGROUPS AND PRESS "POST AN ARTICLE". A WINDOWWILL OPEN. TYPE YOUR HEADLINE IN THE SUBJECT AREA AND THEN CLICK INTHE LARGE WINDOW BELOW. PRESS "CRTL" AND THEN "V", AND THE ARTICLE WILLBE PLACED IN THE WINDOW. IF YOU WANT TO EDIT THE ARTICLE, DO SO, AND THEN HIGHLIGHT AND COPY IT AGAIN. NOW EVERY TIME YOU POST THE ARTICLE IN A NEWNEWSGROUP, ALL YOU HAVE TO DO IS REPEAT "CRTL" AND "V" AND PRESS POST.
7) That's it. Each time you do this, all you have to do is type in a different newsgroup, so that way, it posts to 200 different newsgroups. You see? Now you just have 199 to go!!! (Don't worry, eac hone takesabout 30 seconds; once you get used to it). REMEMBER ..200 IS THE MINIMUM. The more you post, the more money you'll make.AND THAT'S IT!!!! THOSE ARE THE ONLY 3 STEPS THERE ARE!!! You are now in the mail order business, and will start receiving $1.00 envelopes from various people, all over the world, within days.(HINT: THE MORE NEWSGROUPS YOU POST TO, THE MORE MONEY YOU WILLMAKE!). You may want to rent a PO Box, eventually, because of all the mail. If you wish to stay anonymous, you can come up with a name, suchas "manager" or"investor". Just make sure all the addresses are CORRECT, please! LET ME TELL YOU WHY THIS SYSTEMS WORKS!! Out of every 200 postings, let's say I ONLY receive 5 replies, (this is actually VERY LOW). So, I made $5.00 with my name at #5. Now then,each person who just sent me $1.00 makes, say, only 200 postings, now with your name at number 4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours too. 50 people send you $1.00 now; that's $50.00 you just made! Now then, your new 50 agents post 200 each with YOUR NAME AT NUMBER 3, or10,000 postings, (50 X 200). Average return is 500 at $1.00 each, which is $500.00! They make 200 postings, which is 5000 returns at $1.00 each,which is $5000.00!! And finally, 5000 people make 200 postings each,with YOUR NAME AT NUMBER 1. YOU NOW GET A RETURN OF $50,000.00 BEFOREYOUR NAME DROPS OFF THE LIST!! AND THAT'S IF EVERYONE MAKES ONLY 200 POSTINGS, AND IF ONLY A SMALL % PEOPLE RESPOND!!!When your name is no longer on the list, you just take the latest posting that is appearing in the newsgroups, and SEND OUT ANOTHER $5.00 to THE NAMES ON THE LIST, PUTTING YOUR NAME AT #5 AGAIN, AND START POSTING AGAIN!! The thing to remember is, do you realize that THOUSANDS OF PEOPLE ALL OVER THE WORLD ARE JOINING THE INTERNET AND ARE READING THESE ARTICLES EVERY DAY!! JUST LIKE YOU ARE RIGHT NOW!!! So, can you afford $5.00 and see if it really works? I think so.......People have said, "What if the plan is played out and no one sends you the money?" So what! What are the chances of that happening when there are TONS OF NEW, HONEST USERS AND NEW, HONEST PEOPLE joining theInternet and Newsgroups everyday? and, are willing to give it a try? Estimates are at 20,000 to 50,000 new users, each and every day!! Remember, play FAIRLY and HONESTLY and this WILL WORK, I PROMISE YOU!! You just have to behonest. Make sure you print this article out, RIGHT NOW, also, try to keep a list of everyone that sends you money, and always keep an eye on the newsgroups to make sure everyone is playing fairly. REMEMBER: HONESTY IS THE BEST POLICY!! YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE MONEY! GOOD LUCK TO

ALL, AND PLEASE, PLAY FAIRLY; YOU WILL REAP THE HUGE REWARDS FROM THIS.....WHICH IS TONS OF CASH!!! ****By the way, if you try to deceive people by posting the messages with your name on the list, and by not sending the money to the people already on the list, you will not get much. Someone I talked to knew someone who did that, and he only made $150.00; and that was after seven or eight weeks!! Then, he sent the 5 $1.00 bills; people addedhim to their lists, and in 4 - 5 weeks, he had over $10,000.00. THIS IS THE FAIREST, AND MOST HONEST, WAY I HAVE EVER SEEN TO SHARE THE WEALTH OF THE WORLD WITHOUT COSTING ANYTHING BUT OUR TIME! GOOD LUCK, AND HAVE FUN!!!!

1198. NET_Mac2.3.62.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc

Message-ID: <199702211039.LAA08336@iag.tno.nl>
Source record: 31544

The Netherlands, Februari 21, 1997.
Hello dear reader,

NET/Mac v2.3.62 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Make syntax of error- and usage-messages more consistent
- Slowdown the watchcursor when processing incoming mailfiles
- 1996 -> 1997 in Copyright notices, 'rebootonbaddate' etc.
- Some mods to correct my e-mail addresses etc.
- Added: Availability -window in Online-Help

- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

The latest version of NET/Mac can be downloaded from my homepage:
http://www.caiw.nl/~adam

This version obsoletes all versions of info-mac/comm/inet/conn/radio-net-mac
in the Sumex-Aim.stanford.edu (and it's mirror-) archives.

It also replaces /pub/mac/_communicatie/_internet/radio_net_mac_23xx.hqx
on ftp.idg.nl.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft
- wa2zkd mirrors UCSD's incoming on his Landline BBS. Ham's w/o ftp
can call 716-544-1863 or 2645.

NET/Mac will be uploaded to PI1HVH.AMPR.ORG, directory c:/public/mac.

Adam PA2AGA e-mail: a.vangaalen@nitg.tno.nl for mail to my office
or: adam@caiw.nl for private or hamradio mail

Kevin,
The same harness can be used for the HTX-202... RS used the same specs
for mic/spk etc...
Later,
Dave

I have a KPC-3 (eprom 6.0) and a TS-870s (HF) and various 2 meter rigs.
What is the best Windows 95 compatible software? I know of KaWin,
Easyterm, PacketPeT. Does anyone have an article that compares various
software packages? Thanks for your help.

I show 30 9th graders ham radio every year on the air, they also see the
ARRL self serving video tape and I talk about the hobby spewing the
company line.
And you are doing just what?

> There are many of us out here trying to put
> the ham back in ham radio and make it fun again, both for us and the young
> folks. Please quit lumping all hams in one heap and cutting us down. You
> are the one that gives ham radio a bad name to the non hams that read the

There may be "many" as you say but overall these many are a very small
percentage.

I will be very pleased to present myself anywhere on Cape Cod that you
invite me to.
I will not barge in UNINVITED.
I will speak to any group about my views but if off CApe travel is
involved, I need expenses.

Most belong in one group.
The reason few here agree with me is that all those that agree with me
left the HOBBY.

There has been mention recently in the radio press about DAMA and incorporating it using using AX.25 protocol. I undestand that it can increase the throughput on an AX.25 channel significantly.

The Group to which I belong would like to hear from anyone who has practical experience of DAMA with comments, observations etc. and a source for the software.

Not so long as the FCC holds them responsible for message content
transmitted through their systems. Besides, I don't mind you speaking
your opinions, but not over my radios.

Ken,

The GP-300 programming software is LICENSED by MOTOROLA. You must
buy a software license in order to program these radios.

Programming hardware can be purchased either from Motorola or
from a number of other sources. The "connector box" that fits
on the back of the radio is only sold by Motorola.

Total cost for this little endeavor is about 700$US.

Suggestion: Find a commercial Motorola dealer in your local
and make friends.

<burtfisher@geocities.com> wrote:

>It takes guts to kiss ass?
>Thatr is what hams are experts at.

Burt,

You call yourself a teacher? A mentor entrusted to help shape the minds of our young children? Heaven forbid, a roll model? By your posts you have proven that you are incredibly opinionated, not above using foul language in an open forum of mutual learning that is easily accesable by curious young minds, you point your "holier-than-thou" finger at Amateur Radio Operators and seem to have no problem speaking ill-will of this group of human beings. Can you tell me just what exactly it is that makes you a better person than any of these people you speak so poorly of? I am an Amateur Radio Operator myself and I take great pride in it, I also pride myself on being a volunteer interpreter for the deaf, a volunteer for the American Legion, an advocate for the rights of Veterans and the disabled, among other similar interests. I literally volunteer more of my time than I work for a wage, I may be poor but if pride were gold I'm a very rich man.. Can you say that, Burt?

This is America, Burt, and you are by the first ammendment entitled to voice your opinion, but you already know that. I too am an American and am entitled to my opinions and my opinion is that you are a bigot and have no business in the teaching profession if you are incapable of treating other human beings as the equals that they are. In the mean time, I'll be praying for your students..

If you have such a problem with Hams, why not (on the way to church next Sunday) rip up your FCC license into little pieces and go about helping your fellow man in a manner more constructive than the one you have chosen.

John KB7VZL (and darn proud of it)

If you want ANY licensed amateur's address and phone number, do a search for QRZ on the web. Once there, you can input the callsign, and instantly get the info you want. Beware, that sometimes weird people use others' callsigns. Please be careful not to flame an innocent bystander in the process.

Good luck, and please think before you act harshly. The net is fun, and some people just are 'that way'.

The AEA host mode is NOT compatible with WA8DED protocol.
They are worlds apart.

Well dont know of an article that compares all of the
programs. But I can give you another one to look at

XPWIN support AEA (host mode), Kantronics (host mode), SCS/Paccomm
and HAL controllers. It will also drive your TS870s.

It can be downloaded at the site shown below.

>
Hi Mike,

There is an easy fix your problem and it is called a Faraday Cage. A Faraday Cage is "..an earthed metal screen used for excluding electrostatic influences." (The Concise Oxford Dictionary, Eight edition 1990, word 'faraday'). In practice you will purchase a length of chicken fencing wire (diamond shaped patterns or something similar - chicken fencing wire is the easiest to work with) and wrap your computer (or anything generating RF that's not shielded) with it. Allow openings for disk drives etc. and ground the cage appropriately. Retrospectively, the same principle is used in RF cable shielding (Coaxial etc.). Note that for UHF interference you may have to use two or more layers of fencing wire around your computer or a denser material (smaller 'holes' are required, as used in the loading doors of microwaves to stop microwave radiation from 'escaping' through the front door).

Good fencing !

Nope, sorry Burt but I am not an ARRL type person. Those of us that work
with the young folks here show them **REAL*** ham radio and not the tripe
that is spouted by some on the news groups or on the HF bands in certain
places. But then I doubt that you would do any differant to lure the
young in as your posts show that you really only do the motions of trying
not put any heart into it. It is plain to see that your love is in the
commercial area. Yup, I was in the commercial area too, I guess if you
call being a chief engineer for a couple of radio stations commercial.
But that is a differant story....And only has enhanced my abilities and
enjoyment of ham radio.

enuff said. end of thread.

Fred Ke8tq

I may not always agree with what you say. But I will defend to the
death your right to say it.

The right of free speech comes as a bundle with the responsibility of free speech. Since you demonstrate little responsibility yourself it would appear that packet sysops are forced to take responsibility. The pity is that now you will have your electronic tantrums on the news groups. Perhaps if all of those on the news groups who were tired of your spamming were to flood your provider with complaints your provider would take the same action as the packet sysops. Then you could scream your complaints out on the beach.

To answer your as yet unasked question, Yes I would say the above to your face, I just would not fly across the country to do it.

You might be able to find an older HP95LX for under $200, but most of
the HP100LX and 200LX units are $300-$400 dollars. You can look in
comp.sys.palmtops for used Plamtops and H/PCs for sale.

From: "E. Scott Sykes/KF4NDQ" <flashnet@erols.com>
Message-ID: <330F20C0.44CD@erols.com>
Source record: 31437

I am interested in amatuer paging and the KPC9612. I am looking to correspond with other interested parties that use POCSAG to communicate with on amatuer bands. I have found some really neat devices and software that are available for almost everyone. Are there any clubs or services that currently use amatuer paging?

Hello!

Thanks fore reading this mail.

Im looking fore the programming device for a Motorola GP-300.
I also want to have a copy of a program to the PC to run with the programming device.

Du you have any information regarding this, then pls let me know via a E-mail..

Many thank /Kenneth Gyld (SM3VRO)

From: dthimm@unix.newnorth.net
Message-ID: <330f1f7b.6354287@news.newnorth.net>
Source record: 31439

I wrote a program several years ago for the C-64 to make my Yaesu 757 serve as a "Spectrum Analyser" for contesting. I recently converted it into a windows based program.

Anyway, I am wondering if anyone would be interested in such a program. (Either the original C-64 program or the WIndows program)

Also, if this interests you and you don't have a Yaesu, but do have a computer interface to the rig, let me know and I can probably adapt this program to your rig too.

If there is a reasonable amount of interest, I will make it available as a downloadable file on my website.

*** Attention All Ham Radio Operators ***

Are you looking for a more interactive way to chat
with Ham friends that you can't get to over the air?

AR-Net (Amateur Radio Network) has established an
IRC (Internet Relay Chat) server for you to use.

Here's how you can check this out..

1) Get an IRC client application
mIRC seems pretty good to me
(http://www.mirc.co.uk)

2) Dial up your local ISP

3) Point your IRC client to:
ar-net.woodyware.com
port: 6667

4) Change your Nickname to your Ham Call

5) Retrieve the list of channels
(we have 6 channels already set-up)

6) Join the one you are interested in..

7) Enjoy yourself!!

Give it a try.. Put a little more fun in our hobby..

John Woodstock woody@woodyware.com
P.O. Box 436 woody@usbbs.com
Coram, NY 11727-0436 Ham Call: N2HAA
SysOp Services: www.usbbs.com

1242. Remote Level Sensing For Antenna Platform

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-22 00:00:00 UTC
From: rwhiting@winternet.COM
Message-ID: <199702222155.PAA19180@icicle.winternet.com>
Source record: 31441

I'm looking for a remote level indicating system. In particular, I need to be able to monitor from the ground the 2-dimensional "level" of a basket on a boom extended 100 ft., or so, above the ground. The purpose is to assure that several very directional antennas attached around the basket do not change their downtilt angle over a several-hour test period (and allow adjustments from the ground if the platform does creep).

Any ideas about where I can find a relatively cheap level sensor? For example, I understand that some RV's have an automatic leveling system (i.e., that drives hydraulic jacks). What is used for the sensor?

Another thought I have is inverting a joy stick (potentiometer) mechanism with a pendulum attached to the shaft. Then use the X-Y potentiometers in a bridge arrangement with a couple of meters.

Is there a cheap, KISS approach to this using good 'ol ham ingenuity?

Ideas hereby solicited. Replies by e-mail preferred to keep the S/N down on the newsgroup. Thanks.

Cheers/ Rick W0TN

Released with the permission of the author who required no editing take
place:
(this is what a person of class and intellect says, it does not
necessarily agree
with me and where he does not he resorts to facts over insults).
Burt

>Hello Burt,
> I just wanted to drop you a note concerning the thread currently running
on the rec.radio.amateur.equipment newsgroup. After ready the many
replies,
flames, etc, I would have to agree with *some* of your comments and
thoughts. I think you have a picture in your minds-eye of the "typical"
ham
operator being a rag-chewing, cigar smoking, foul-mouthed,
over-glorified
CB'er. Though there are MANY that fit that bill, but, I think better
than
half don't fit that desciption. As I'm sure you know, there are many of
us
who do public service such as Skywarn, RACES, ARES, etc. To group those
of
us who do public service with the lids is an unfair condemnation. I
literally put myself at risk when I go out and spot for the weather
service
and don't look at myself as being involved with a hobby at that point,
but
rather, an important part of a system that can and does save lives.
> After looking over your website, following the thread for the past few
days, and reflecting on the garbage I hear on some of the bands, I can't
argue with a good portion of your comments. Many of the respondants have
been very articulate, others have shown that they think with their
southern-most body part. I believe you are a person who is truly
concerned
about the state of Amateur Radio and it's related services. Your
opinions
may not neccessarily be within the mainstream of the hobby, but they do
count, and I respect that. I hope that you can also respect the efforts
of
those of us who DO look at Amateur Radio as a way to help others, and
show
that by doing the service work. We are not all lids, and I hope you can
see

that.
> I decided to send this note to you personally, rather than through the newsgroup, so as to try and get it back to the subject it is supposed to cover. I look forward to your reply, and your thoughts on my comments.

For sale: HAL P38 multimode data communication interface.
Modes: Clover, Amtor, Pactor, RTTY, ASCII, baudot

Manual & PC terminal software included.

Is as new, hardly ever used.

HAL asks $349 for this, will sell for $285, you ship

I will throw in a PC 955 computer for free, made by Texas Instruments, with
150 meg HD.
This is a mini-sized 286 AT compatible which is more than good enough to
handle the terminal software task.
This PC is the quietest PC I ever owned in terms of RF noise, you won't
notice the difference between ON and OFF

I suspect you are a ham in the tradition of KV4FZ, that notorious personality of the (14.313 MHz) airwaves. Never the less, I would enjoy meeting you on the air sometime, say, on 20 Meter phone in the General class portion of the band. I know you are a cw buff but I think phone would give a bigger audience for you and allows others to make comments more readily. However, if hams are as gutless as you say, there should be few comments.

As far as the facts about Little Leo's are concerned, I am sure you are armed with all sorts of technical data about their compatibility with the existing uses in the bands. However, I would like to know where you got such data because everywhere I go says that such data does not exist.
This is not to say that such data would change my position. I am against any commercial intrusion into the amateur radio allocations, especially the ones that are being fully utilized such as the 2 M and 75 cm bands.

I look forward to your reply.

Sincerely,

Michael Goad

Actually, Burt, your news article has helped me to decide in favor of
sending the FCC an e-mail in SUPPORT of the ARRL's position and to
further encourage every ham I talk with to do the same. If you are so
against amateur radio and all it is and does that you are willing to let
the commercial interests come in and take over (you know they won't be
"shared" for long) two of the most utilized bands we have, why don't you
turn in your license and get out of ham radio all together.

If you believe that protecting the interest of amateur radio is not in
the best interest of the general public, perhaps you should come down
and
talk to some of the victims and rescuers involved in the aftermath of
hurricane Andrew in Dade County, FL. Amateur radio's ability to be used

in times of disaster is highly dependent on the bands the little leo's want. We cannot allow any intrusion on these bands if we are to be useful
to the public in times of emergency.

For the record, I am a communications technician for the fire-rescue department of a local county, so I do have some first hand knowledge of the events following hurricane Andrew and the utilization of amateur radio there prior to the arrival of outside help from FEMA and others. Because of its usefulness, there has been a greater effort by the local governments in south Florida to work with the amateur radio community to ensure that this service will be available in the future. Many agencies now have amateur radio stations in key facilities and have lined up operators to run them in emergencies. Some have provided learning materials for their own personnel who expressed interest in becoming ham radio operators.

I am not sure what your motivation is in backing the little leo's, but I suspect it is financial. What we are talking about here goes way beyond the almighty dollar in my book. I am here to let you and all who read this that we will fight this to the end.

Sincerely,

Michael Goad

1249. Tuning a PLL or DDS transceiver...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-22 00:00:00 UTC
From: johnla1018@aol.com
Message-ID: <19970222235501.SAA00755@ladder02.news.aol.com>
Source record: 31448

If anyone has knowledge on how a PLL or DDS transceiver is tuned I would be very grateful. I realize that a programmable frequency divider in the PLL is programmed by a dedicated microprocessor to change frequency. But when someone turns the tuning dial on the radio, how does this command get to the microprocessor? Is it through an optical-shaft encoder sending a digital code directly to the microprocessor, or is it a potentiometer feeding a rising or falling DC signal to an A/D converter, which then feeds the microprocessor, which then commands the PLL? Can't seem to find the info in any book in a simplified form.

Thanks very much!

John Lasko

In actuality, Burt has been invited numerous times to a moderated roundtable type forum on the band and frequency of his choosing. Each time, he is, what is referred to as a no show, thus proving the saying that those who talk the talk (the gut vs gutless scenario) don;t necessarily walk the walk

Look for the Burt special event station to be setup VERY near his home sometime around the end of March. The amateurs of Cape Cod and surrounding areas will be invited to attend this. One special feature will be to show Burt in his true environment. Hopefully, Burt will make an appearance and even work some stations (after all, we will be parked in his neighborhood) We (and there is going to be more than one) will be connected to the Internet and will be demonstrating the public minded Burt to all his neighbors

More details as time progresses

I will appear on 20 meter voice and you can gather a crowd as I doubt
you can talk to me without a fan club for support. Hams are as gutless
as I say. If there are comments there will be no calls attached to them.

Total bullshit. Tommorow is Sunday let us have a go at it.
I can go on almost ANY band.
Why don't you cite ANY time a ham has accepted my challenge, they always have an excuse, (my rig is packed away, the antenna is down, or just no reply).

I already told a local ham of your offer. If I am invited I will come.
The local hams despise me more than you do but they have zero guts.

You know I do not hide, you can see AND hear me on my WWW page, can you say the same for any others around here?

As much as I disagree with Burt Fisher, I think that if any ham radio
operator follows your suggestions then they are no better than the
people
Burt is talking about. We must rise above this.

Hi John;

Gave it a try using your instructions, worked first try. It's still new I guess, as I was only one on at this time. I urge other hams to try it also, as there are 6 chat rooms, and one is a swap shop. This is a great place for hams to meet live.

Ham Radio Online at http://www.hamradio-online.com is the world's leading amateur radio web site, read in 63 countries around the globe.

If you have not checked us out, stop on by and enjoy. There is always something new. We probably have more Amateur Radio "content" (articles, news, propagation reports and charts, disaster communications situation updates, photos and more) than any other Amateur Radio web site in the world. Hundreds of articles in the archives.

If you've been by, check on back and see what's new. We do updates every few days, sometimes every day depending upon our time.

We run Ham Radio Online as a self-funded, no ads web site devoted to radio communications and telecommunications topics. In spite of our professional appearance, we run the web site as a hobby.

>potentiometer feeding a rising or falling DC signal to an A/D converter,
>which then feeds the microprocessor, which then commands the PLL?
> Can't seem to find the info in any book in a simplified form.

Optical shaft encoders are almost the universal choice today.
Some may use a special chip to keep track of knob rotation by
one of several means and present a number to the microprocessor.
This may be either a serial or parallel interface to the micro.

Others may have an encoder disk using a Grey Code and a multibit
optical reader to give a direct shaft position readout. This will
almost always be a parallel interface to the microprocessor.

But most seem to drive microprocessor interrupts directly from
a pair of photosensors reading an alternating black/white ring,
or a toothed ring, turned by the knob. The sensors are arranged
so that they are spaced "X and a half" segments apart on the ring.
Thus you can determine not only when the knob transitions from one
step to the next, but also which way it is turning by noticing
which sensor saw a transition first.

The rest, as the hardware guys say, is just software.

Actually the 9th graders do not need to hear my views. They have open
minds.
They are far more alive than most hams or ASDers.
I do not have a Packard Bell.

Source record: 31370

DMARC - The Digital Mid-Atlantic Radio Council

Annual Membership Meeting: Saturday, 8 March, 1 PM at
the Prince George's County EOC, Seat Pleasant, Maryland

Address: Post Office Box 73, Accokeek, Maryland 20607

Want to learn about the latest changes in the digital band plans for this area? Are you wondering what the current state of the packet network is? Interested in the newest applications of APRS? If you answered YES to any one of these questions then please accept our invitation to attend the DMARC annual membership meeting! We will be holding this event on Saturday, 8 March in Seat Pleasant, Maryland (near the US Air Arena) beginning at 1 PM.

The meeting will be held at the Prince George's County Central Communications Facility (EOC) on Anchor Street. From the Capital Beltway (I-95), take the Central Avenue exit and proceed west on Route 214 (inside the beltway) for about 1.5 miles. Turn right on Jonquil Avenue, go one block to Anchor Street and turn right into the EOC parking lot. After parking in the designated spots for visitors, enter building using the door located behind the flagpole. The EOC is located on the second floor. Talk-in will be available on the 147.18 MHz repeater and 146.52 MHz simplex (for close-in directions) and refreshments will be served.

This year, the Board of Directors of DMARC are working hard to improve the digital infrastructure in the Mid-Atlantic area and assist all digital mode enthusiasts by helping to minimize unintended mutual interference through effective band planning efforts. In partnership with T-MARC, DMARC is committed to making a positive impact in this critical area to ensure that every ham has the best possible chance to enjoy his or her specific interest area. At this meeting, we will talk about our recent band planning agreement and assignment of digital frequencies on the 2-meter and 440 MHz bands. Digital band planning activities, including researching spectrum utilization and projecting growth trends, have long been a focus of DMARC and will continue in 1997. We need your input and assistance to ensure that this valuable work continues.

In 1997, DMARC plans to continue its focus on education, innovation and leadership. The Mid-Atlantic area needs a strong, energetic organization that champions digital mode technology and operations. Do you agree? If so, as we suspect, then DMARC is for you! We need new members who care about amateur radio digital mode development.

Please consider coming to our membership meeting and learning more about how you can help. Our membership dues are very low and are used exclusively to promote ham digital growth. All new members signing up at this meeting will be given a free copy of the 1997 edition of "The DMARC Mid-Atlantic Digital Resource Guide".

Whether you are a packet user, DX Cluster operator/user, BBS sysop, APRS enthusiast, spread spectrum guru or just enjoy tinkering with digital projects, we need your support. Please consider coming to our meeting and helping us out - we hope to see you on 8 March!

1268. T-MARC Press Release

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-23 00:00:00 UTC
From: Stan Staten <3winks@msn.com>
Message-ID: <01bc219c$65394c80$674060cf@sstaten.erols.com>
Source record: 31372

TMARC Press Release

1/15/97

TMARC, along with representatives of the digital and ATV community, have formulated changes to the 2 meter and 3/4 meter bandplans that we feel will

be beneficial to all. We are asking all amateurs with an interest in these bands to review the proposed changes and comment by March 31, 1997. Please send comments to :

TMARC
attn: DAC bandplan
P.O. Box 1022
Savage, Maryland 20763-1022

The proposed time table for implementation is as follows:
Begin public comment period, ending March 31, 1997.
Adopt final recommendations in April 1997.
Transition period to new bandplan, ending January 1, 1998.

The proposed changes are as follows:

1.) Move replexers to 147 MHz splinter simplex channels starting at 147.405

Mhz. Note that the recommended simplex channels are on 30 kHz spacing from

147.42 to 147.57 Mhz inclusive. After Jan 1, 1998 there is to be NO digital activity above 145.79 MHz.

2.) 144.91 to 144.99 MHz be designated as digital.

3.) Change 144.3 to 144.5 as follows
144.3 to 144.4 - digital
144.4 to 144.44 - experimental
144.45 to 144.5 - space
NOTE that these frequencies are band edges, not channel assignments and that operation in these sub bands be contained per the FCC rules on technical standards.

4.) Change 446.025/.050/.075 MHz to digital adding 3 digital channels, and deleting 3 simplex channels.

5.) Change the sub band from 433.325 to 433.775 MHz from links as follows:
a.) Channels 433.325 to 433.375 MHz be designated as `experimental'.
b.) Channels 433.400 to 433.575 MHz be designated as `digital'. Note that if channel spacing of 20 kHz rather than 25 kHz is used, the channels would

be 433.400 to 433.580 MHz.
c.) Channels 433.600 to 433.650 MHz be designated as `experimental'.
d.) Channels 433.675 to 433.775 be designated as `simplex'.
Links coordinated at the time of adoption be `grandfathered' in, but upon their cessation of activity, if ever, the channels are to be used as designated. This change adds 5 simplex channels and 8 to 10 digital channels.

6.) Recommend that digital activity in the 441 MHz subband adopt quiet hours, where practical. These quiet hours are from 7 pm to 11 pm every evening and apply only to stations within the defined service area of the coordinated ATV repeaters. For practical purposes, these service areas are

the metropolitan areas of Baltimore, Md and Washington, D.C. While it is recognized that not all stations can adopt quiet hours, the new channels at

446 and 433 MHz offer spectrum where stations, especially high power stations, may move to that will not interfere with the ATV interests.

1269. DRAFT DMARC Digital Plan

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-23 00:00:00 UTC
From: Stan Staten <3winks@msn.com>
Message-ID: <01bc219c$75c08fa0$674060cf@sstaten.erols.com>
Source record: 31373

Digital Frequency Plan DRAFT
DRAFT for approval vote at the 3/8/97 DMARC Meeting

NOTE: Changes are dependant on positive vote on T-MARC updates vote.
Please see T-MARC press release.

Digital frequency utilization in the TMARC/DMARC area - MARCH 1996

CHANNEL USE GUIDELINES

Note: The secondary use MUST cease upon request of a primary use
provider (i.e. the BBS/cluster sysop could demand that an interfering
forwarding link cease, but not a BBS user. A specific example is the
long standing policy of no AX.25 bulletin forwarding on 2-meters in the
evening to provide better user service).

50.610 - 50.760 - Network inter-node linking
50.780 - 6M TCP/IP Node
51.610 - 51.660 - Network inter-node linking
51.680 - Network inter-node linking
51.700 - 51.99 - Network inter-node linking

To ease individual user access to networks BULLETIN forwarding on
2-meters will not be done from 7 pm to 11 pm every evening. As a
general rule, forwarding should be done on 219 MHz or higher.

New Frequencies transition period to 144.xxx frequencies ending by
January 1, 1998.

144.31 -
144.33 -
144.35 -
144.37 -
144.39 -

144.91 - BBS 9600 bps only (user access primary, linking secondary)
144.93 - DX Packet Cluster
144.95 - TCP/IP network 9600 bps (linking primary, user access
secondary)
144.97 - BBS/node 9600 user access (user access only, no linking)
144.99 - DX Packet Cluster

End new frequencies

145.01, .03, .05, .07, .09 - 1200 BBS/Nodes/Forwarding
145.51 - 145.53 - DX Cluster
145.55 - Space downlink (MIR & SAREX) primary; temporary point-to- point
use secondary (NO BBS, mailboxes, digis, nodes, servers, etc.)

145.57 - DX Cluster
145.59 - DX Cluster
145.61 - BBS/Nodes/Forwarding, TCP/IP
145.63 - DX Cluster
145.65 - BBS/Nodes/Forwarding, TCP/IP
145.67 - 1200 User/BBS (No BBS<-->BBS)(no forwarding)
145.69 - 1200 User/BBS (No BBS<-->BBS)(no forwarding) DAREN network (WV)
145.71 - DX Cluster
145.73 - SKYWARN/ARES/RACES AX.25 (See VDEN Guidelines)
145.75 - TCP/IP RACES EOC links (primary), RACES LAN (secondary)
145.77 - Keyboard-to-keyboard use, SEDAN (primary); any secondary use
must be compatible with SEDAN
145.79 - APRS Location (Nationwide)

147.57 - Use of this frequency to end by January 1, 1998

219-220 - Wide-band forwarding links (10 channels)
223.52 - direct keyboard to keyboard operations
223.54 - Network inter-node linking
223.56 - Network inter-node/BBS/user
223.58 - Network inter-node/BBS/user
223.60 - User Access. No BBS forwarding or DXCluster
223.62 - Network inter-node linking
223.64 - Network inter-node linking
223.66 - Network inter-node linking
223.68 - Network inter-node linking
223.70 - DXCluster
223.72 - 223.78 MHz

43x.xx - DX Cluster
432.950 - TCP/IP 56 kbps backbone; MD RACES Network

New Frequencies

433.400 - High speed networking
443.425 - High speed networking
443.450 - High speed networking
443.475 - High speed networking

NOTE: Despite longstanding digital use, 440.925 - 441.275 have the
potential for ATV interference in selected areas. These problems should
be resolved on a case-by-case basis. To ease the potential for
interference BULLETIN forwarding in the 441 MHz subband will not be done
from 7 pm to 11 pm every evening. This applies only to stations within
the defined service area of the coordinated ATV repeaters. For
practical purposes, these service areas are the metropolitan areas of
Baltimore, Md and Washington, D.C. While it is recognized that not all
stations can adopt quiet hours, the new channels at 446 and 433 MHz
offer spectrum where stations, especially high power stations, may move
to that will not interfere with the ATV interests.

440.925 - 9600 User/BBS/Forwarding
440.950 - 1200 SkyWarn/Public Service (VDEN)
440.975 - 1200 BBS/Forwarding
441.000 - 1200 User/BBS/Forwarding
441.025 - 1200 User/BBS/Forwarding
441.050 - 9600 User/BBS/Forwarding
441.075 - 1200 User/BBS/Forwarding
441.100 - 1200 Keyboard - Keyboard (simplex)
441.125 - 1200 Keyboard - Keyboard WAN
441.150 - 9600 Keyboard - Keyboard (Simplex)
441.175 - 9600 Keyboard - Keyboard WAN
441.200 - 9600 User/BBS/Forwarding
441.225 - TCP/IP
441.250 - 9600 User/BBS/Forwarding
441.275 - User/BBS (No BBS <--> BBS)

DX Cluster transition to these frequencies immediately upon approval of
T-MARC update vote

446.025 - DX Cluster
446.050 - DX Cluster
446.075 - 1200 User/BBS/Forwarding

446.200 - TCP/IP
446.500 - Shenandoah Valley WAN
446.225 - DX Cluster
446.100 - High speed MDCVA WAN
446.250 - DX Cluster
446.125 - 9600 User/BBS/Forwarding
446.275 - DX Cluster
446.150 - TCP/IP High Speed WAN
446.175 - 1200 User/BBS/Forwarding

904 - 906 MHz channels starting at 904.020 and spaced at 30 kHz
916 - 918 MHz channels starting at 916.020 and spaced at 30 kHz

DRAFT

Could someone perhaps post his address and phone number here too?
I am sure that a lot of readers would enjoy having them!

Source record: 31380
Cross-posted to:
alt.support.divorce,rec.radio.amateur.digital.misc,,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space

I am the way I am because as a teen I was an active ham radio operator. I used "the mike" to not face real people thus missing my teen years the way real people experience it. It is not ham radio's fault of course, the fault is entirely mine. However I am not that person now and I despise in others what I despised in myself. I am much like a reformed smoker (they tend to be fanatics against smoking). When I hear hams on the air blabbing on about nothing, doing nothing, being nothing, kissing each others butts so much their lips turn brown I want to anything other than be like them. Further I was a gutless wimp up to 18 years of age (fit
in well with ham radio), I would cower with the slightest threat but I learned that fear is far worse than being beat up and rarely would have anyone beat me anyway. So today if you want to threaten me the odds are high (especially if you are a ham) that nothing will ever be carried out. And if threatened I always tell the person to carry out the threat even if my acts that caused the threat were wrong because once you threaten me that closes the door as to the legitimacy of your cause.

To those folks in the ASD support group much of the above applies. Most of you are uncaring men whose spouses finally wised up (hams make great uncaring spouses). In the end I am a far deeper and caring person than 90% of you. And to those that PERSONALLY insult me and/or use profanity, those acts say so far more about you than I. If you read my mail carefully you will rarely see me personally insult anyone and rarely will I use profanity. I argue ON THE MERITS. When you see someone attack the person it means their cause is without foundation.

Exactly..*I* am the owner/operator of the PBBS and *I* decide what gets read. *I* take the input of the people who utilize MY equipment, *I* decide what content is acceptable or not. Not YOU or the FCC

That's who the hell *I* am. *I* and the others on my PBBS consider your posts inappropriate to anything related to amateur radio, hence, no posts.

I firmly believe you have every right to show the fool that you may or may not really be. HOWEVER, I DO NOT repeat, DO NOT have to give the platform to prove it. That's for others to do.

If you're suggesting that I have to allow you to access my property (equipment, etc.) then you are barking up the wrong tree.

1282. Re: Tuning a PLL or DDS trans

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-23 00:00:00 UTC
From: len.anderson@mogur.com
Message-ID: <970223142653460@mogur.com>
Source record: 31386

JO>From: johnla1018@aol.com (JohnLa1018)
JO>Subject: Tuning a PLL or DDS transceiver...

JO> If anyone has knowledge on how a PLL or DDS transceiver is tuned I
JO>would be very grateful. I realize that a programmable frequency divider
JO>in the PLL is programmed by a dedicated microprocessor to change
JO>frequency. But when someone turns the tuning dial on the radio, how does
JO>this command get to the microprocessor? Is it through an optical-shaft
JO>encoder sending a digital code directly to the microprocessor, or is it a
JO>potentiometer feeding a rising or falling DC signal to an A/D converter,
JO>which then feeds the microprocessor, which then commands the PLL?
JO> Can't seem to find the info in any book in a simplified form.

Both PLL and DDS frequency control subsystems generally use an optical shaft encoder which feeds a simple up-down shift register to hold the equivalent frequency position of the shaft. A microprocessor isn't technically essential but greatly reduces the necessary hardware...it will translate the shift register equivalent frequency position into a binary word representing the actual frequency, allowing for IF offset in the LO control. The specific PLL or DDS control then utilizes this translated frequency word.

Several of the PLL control systems have been explained in periodicals and literature, notably in the last few years of HAM RADIO magazine (sold to CQ some time in the past). For some good texts I would recommend "Frequency Synthesis by Phase Lock," by William F. Egan, Wiley 1981 or "Phaselock Techniques" by Floyd M. Gardner, Wiley 1979. G.E.C. Plessey and Motorola application notes are good as well as more modern. The basic systems in the Egan and Gardner texts still apply today; instead of using many discrete low-scale devices, modern designs lump all of those discretes as part of a large-scale IC.

The microprocessor in the modern transceiver or receiver does a number of sequential tasks, including translation and control of the numerical frequency display and memory. While not apparent, it saves manufacturing costs by elimination of many different physical control couplings for various functions. All of that can be done by discrete components but at an increase in cost.

In some designs, there is a form of direct analogue control by DC voltage used by small frequency control range functions such as Receiver Incremental Tuning or RIT. Direct DC control is difficult over wide tuning ranges due to potentiometer noise and the small jumps from winding to winding on wirewound potentiometers.

The BBS for which I'm a co-sysop has been on the air for about 8
years, and in all that time we have never locked one legitimate ham
out of the BBS for any reason. We've handled dozens of Burt's
rantings, as have all the upstream SysOps, obviously. Burt loves to
tar hams with a broad brush, but he gets more on himself than he does
on others.

Garry,
Thanks for the reply. WB1ERG, Steve, recommended this program on Friday even before you did! I found it on the Web and have downloaded a copy to try. BTW, I have 2 sons 13 & 15 who are hams. Will the registered version allow us to change the callsign (& create a separate log) as the operator changes? From the writeup, it looks like what I need.

1288. WinPack V6.20 Upgrade

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-24 00:00:00 UTC
From: Roger Barker <roger@peaksys.demon.co.uk>
Message-ID: <isYADFAIZcEzEwyh@peaksys.demon.co.uk>
Source record: 31307

The WinPack upgrade to V6.20 is now available. It can be found on:-
ftp.demon.co.uk/pub/ham/winpack.

The two files to download are UPDT620S.EXE and UPDT620S.TXT. The text file contains instructions on how to use the EXE file, and details of the changes from V6.10 to V6.20 - there are 32 changes listed.

(If you've already got UPDAT620.EXE, the only change in the 'S' version is a slightly modified SPEECH.EXE. If your speech works ok, you don't need it!).

To use the V6.20 update, you must have already installed WinPack V6.10, which is available on the same site as WINP610.ZIP.

Some of the highlights of the V6.20 update are:-

Support for HTML on AX25! This is at two levels. Firstly, if a bulletin or personal message contains HTML, it can be automatically viewed using your web browser. Secondly, you can use Netscape online to a BBS's files area or someone else's PMS to view html documents. This includes support for interactive links in the documents. Starting a Yapp download can be as easy as clicking on a link in Netscape.

Support for auto-viewing of the contents of received 7plus files, even if the data is zip'd.

Support for TF and WA8DED firmware host modes.

Actually the ADI Webpage DOES indeed have an accurate connection diagram.
Check out http://www.adi-radio.com/mobilepack.htm for more info.

Move antenna farther away from the computer.
If it is a yagi, install it in a location such that you can point it
away from the location of the computer.

Hi there.
Our club was recently donated some Motorola MAXAR 440 radios.
These are the ones with the plastic pop-off covers.
Question:
Our LAN on 444.3 is soon to be switching from 1200 to 9600bps.
What modifications must be done to the radio for it to work?
I assume there ARE modifications that can be done to the radio?
What do the mods actually do? clean up input/output audio?
new to 9600---

Hi to All,

check out Altavista.Digital.COM and search for ETHRAX25.ZIP. This
is a packet-driver for DOS which emulates an ethernet card over
a TNC in KISS mode. Works pretty fine with TRUMPET-Winsock.

Sincerely

Alexander Ackermann

I am thinking of getting on 9600 baud packet and have heard that
the
Motorola Mitrek vhf high band radio is a good radio to use for this. I
would be interested in hearing from anyone using this radio for this
mode about any necessary mod's or other hints they may have. For the
tnc,
I will probably use my PK232MBX with the G3RUH style modem from TAPR.

Any thoughts? You can e-mail me at ka4ezy@flinet.com

You are technically correct, but ethically wrong wet. If you set up
to provide a public service as a BBS, you have a moral obligation to
forward all legal mail, or at least not to limit forwarding based on
personal considerations such as who is saying what. SysOps who censor
mail are a big problem on the ham BBS network, and responsible SysOps
should and will route around them.

If you're not part of an open network, you're just cluttering up
valuable space on the bands, and are giving jerks like Burt more
ammunition.

snip...

A reverse diode across the coil is important since it protects the coil
from the otherwise large counter EMF across the coil during break. (I
measured 450v peak across a 24v relay coil during break.) However, such a
diode increases the break-time.
By placing a resistor in series with the diode, the break-time can be
decreased and the counter EMF held to a reasonable amount. As a rule of
thumb, the series R should be 2 to 3 times the coil R. More R =s faster
break-time, but with the trade-off of more counter EMF volts.

The make-time of a DC relay can be decreased by connecting the coil in
series with a resistor that has 3 to 5 times the resistance of the coil.
Naturally, this arrangement increases the voltage needed to operate the
relay. For example, a relay has a 240 ohm coil rated at 24v. A 720 ohm
resistor is connected in series with the coil. In order to produce 24v
across the coil, 96v must be applied to the series coil/resistor. This
circuit is recommended by Jennings, the company that manufacturers
vacuum-relays.
Here's how it works: Relay coils have inductance. For instance, the
Jennings RJ-1A's 26v coil has about 0.3H. It takes time to overcome the
inductance and build up a flow of current before a relay can close. The
circuit described temporarily provides more coil voltage at make, thereby
shorting the time it takes for current to build up in the coil. I
measured a make-time decrease of roughly 65% with the circuit described.

WHY is it that the power-monger, ol'-boy repeater coordination groups INSIST on screwing the digital community every time. Not ONE single repeater pair for digital application in this whole plan. Is it ignorance, or just an unwillingness to give up ol'-buddy-Joe's talking-beeping voice machine. Hell, even the 1970 ARRL plan allocated 146.82 as a digital repeater freq! Seems to me the local coordination groups are making negative progress.

On the other hand, who needs them. There is nothing that would prevent folks from running packet through the local bent-pipe voice repeater. Give it a try! If nothing else you'll be sure to generate some activity!

> there is mention of how this increases relay switching time, obviously
> a bad thing for packet.

In simple terms, a magnetic field holds the relay in, and the diode
prevents
the field from collapsing as fast by turning the voltage created by the
collapsing
magnetic field back into a magnetic field for some milliseconds.

Another reply suggested a zener diode - this works, and can be used to
"tune"
the release time by selecting different voltage diodes. Note, you will
need both
a zener and a regular diode in series to do this.

If you want the fastest release time let the voltage go really high by
using a
power mosfet to drive the coil. Most power mosfets have a decent breakdown
voltage rating and many are spec'ed for certain breakdown energies. Don't
use any diode across the relay coil, just let the voltage go up to the
mosfet's
breakdown (which could be well over 100 V).

I have seen the IRF613, anong others, work very well in this application.
Most
any power mosfet will likely do. Just because the thingy breaks down
doesn't
mean it gets hurt... Try it!

...Peter

1310. What's an FBOM?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-24 00:00:00 UTC
From: n9vjg@aol.com
Message-ID: <33113692.3537669@news.imaxx.net>
Source record: 31395

Are you reading this? Great! That means it wasn't written it for nothing. Not to worry, you won't be wasting your time.

Amateur Radio is a hobby and like all hobbies, it needs to be fun and rewarding. We at FBOM Magazine may not be able to straighten out your 40
meter beam after a hurricane or stop commercial satellites from squatting
on your VHF repeater input, but what we can do is present a lighter side
to all the QRM.

FBOM Magazine is the new generation of radio hobby publications, focusing
mostly on amateur radio operators (Hams). FBOM Magazine is for everyone,
from the guilt-ridden Extra class ham to a Technician or CBer that's tired
of being blamed for the erosion of family values in America. FBOM Magazine, the official publication of the Bad Signal Club--A free-thinking
state of mind where you are certified to transmit scratchy signals, crack a
joke without saying "hihi," tune up on some Little LEOS and have a good
time laughing at others as well as yourself.

As if that wasn't enough, FBOM also pokes it's nose into the world of the
scanner junkie and the strongest competition to wireless communications,
the Internet.

*
* GET YOUR FREE SAMPLE ISSUE!!!
*
* Email N9VJG@aol.com now for your free sample of the latest issue!
*
* Visit our Web Site which is still under construction and
* in bad need of updating. Just nudge your favorite browser to:
* http://www.interaccess.com/uncle-del/FBOM/.
* If you have America Online, visit the FBOM Magazine folder
* in the Ham Radio Forum message boards, under "Manufacturers,
* Dealers & Vendors."
*

Why YOU should subscribe to FBOM Magazine:

1. You will earn your official Bad Signal Club membership and will be
able to operate any bands with a scratchy signal and tell the
complainers
to stick it where the sun doesn't shine.
2. Blatantly hilarious and unusual commentaries on life as a radio
hobbyist.
3. No boring propagation charts. We replaced those with "Radio
Horoscopes".
4. No articles for home-brewing outrageous tri-banders and RF amps.
Just
step-by-step guides on how to build contraptions like a
"rubber-duckie
plane" for your HT and how to clean nasty things out of your
microphone.
5. Wacky contests where you can win antennas, free chunks of used
RG-58
and other prizes.
6. Free classifieds for paid subscribers.
7. We don't make you feel inferior if you work channel 19.
8. Hey.. we're writing it, so why aren't you reading it?
9. FBOM is 100% biodegradable and fat-free!
10. No test is required for this upgrade.

Why YOU should subscribe to FBOM Magazine NOW:

Rates are CHEAP! 2-year (4 issues) subscription rate of $9. 1-year
subscription rate (2 issues) for $5.

For only $9 you can have 4 issues of FBOM Magazine delivered to you.
Hey
that's a pretty good deal--especially for a publisher that is terribly
desperate to gain more subscribers!

How you can give us your hard-earned money:

*
* Mail a check or money order for a 1 or 2 year subscription to
* "Eric Bond" (That's me, the publisher and janitor) and send it
* to FBOM Magazine, P.O. Box 7711, Westchester, IL 60154-7711.
*

Actually it does. I myself agree 100% with the above. HOWEVER, there is nothing that compels me to provide you with the soapbox by which you may practice it.

>And why does the low tone on my IC706 not match the other low tones
>I've seen listed?

The obsolete amateur standard used in the early time had 2125 and
2975 Hz tones, i.e. a 850 Hz shift. The IARU conference at Warswa
decided to use the tones at 1275 and 1445 Hz of the now usual 170 Hz
shift on SW and 1275 and 2125 Hz for the 850 Hz shift, if my memory
serves me well.

Source record: 31403

-----BEGIN PGP SIGNED MESSAGE-----

I've been trying to interface a Standard C528A HT with a Kantronics KPC-2. I've almost been successful in that I have been able to get the combination to transmit before it all goes south. I've moved the jumper as recommended in the handbook from posistion one to position two. I've built the interface cable using the .1uF cap and the 2.2K resistor as shown in the manual. Still no luck. The combination will transmit twice and then the TNC's xmit light comes on but the rig doesn't key. If I turn the HT off and then on, I can transmit two more times. Any help would be greatly appreciated!

The 1997 National Amateur Golf Tournament is quickly nearing with only 6 weeks of registration left before play begins in mid-April all across America.

If you are a golfing enthusiast who enjoys playing competitively this may be the tournament opportunity you've been waiting for.

With the national pot expected to be well over $125,000 this year, this could very well be the chance you've been looking for to prove your golfing prowess.

For further details regarding the tournament and registration with The Silicon Hills Golfing Association please e-mail <Zider@msn.com> for all details pertinent to the tournament (registration, play, and prizes).

We look forward to hearing from you and finalizing the memberships for this year's National Amateur Golf Tournament!

The Silicon Hills Golfing Association

1329. Pactor-II vs HAL

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-25 00:00:00 UTC
From: Tobias Port <tport@vector.wantree.com.au>
Message-ID: <33129F7E.473D@vector.wantree.com.au>
Source record: 31332
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.digital,rec.radio.amateur.misc

I was slightly annoyed when I discovered the official statement in the packet radio network written by Bill Henry, the president of HAL Communications Corp. (manufacturer of the CLOVER system) putting down PACTOR-II, which is a competitive product manufactured by SCS in Germany. Is
HAL so concerned about their market share that they need to initiate a "battle" in the amateur radio world and spread such a bunch of accusations?

In the last couple of months, several comparisons between CLOVER and PACTOR-II have been published. Whatever the source was, all serious tests
showed that PACTOR-II actually performs better. This may appear somewhat embarrassing, but it is the truth. For example, just see the July 96 issue
of the QST magazine which includes a comparison from the National Telecommunication and Information Administration (NTIA) in the US. There should be no doubt that these results are unbiased, especially since the authors claim that the findings were used by the Federal Emergency Management Agency to determine which protocol could be used in case of an
emergency. Another comparison with similar results was published in the November issue of the QST. I also talked to several people, and everybody
who really compared both modes considered PACTOR-II to perform better, and
that is also my own experience. A friend of mine mentioned a test setup which he used to check the performance of both systems: He used two transceivers with ten watts HF output each that were connected to two dummy
loads and two modems. A third transceiver, which was connected to an antenna, was used to transmit white noise. When using two CLOVER boards, which were linked over the residual HF radiation of the dummy loads, it required 8 Watts of the noise transceiver to break the link. When using CLOVER-2000 (the commercial 2 kHz 8-tone wide band version which is also mentioned in the HAL file), only 4 Watts were required to break the link.
When he used two PTC-II units instead of the CLOVER hardware, he was not even able to break the link with the maximum noise power of 150 Watts, and
traffic was still going through! This is of course no standardized test, but
it is easy to reproduce and clearly shows the relation of the robustness

of
both systems. Due to such personal tests and especially due to the
comparison of the performance of both systems in real band conditions,
more
and more people change from CLOVER to PACTOR-II. For example, the entire
store&forward traffic of the world-wide WinLink BBS system, which used
to be
done in CLOVER, is currently switched to PACTOR-II. A similar
development
can also be observed in the commercial field. So that's what the
customers
REALLY say, and that's what performance REALLY speaks. One day,
everybody
will realize which of both units performs better, especially since there
is
no relevant improvement of the HAL software. For example, the CLOVER
hardware is still only able to operate the same few modes, to say
nothing of
the simple construction which hardly allows any significant improvement
of
the performance due to the limited processing power. The latest firmware
for
the PTC-II however, which was released just a few weeks ago, provides
another two new modes (FAX and SSTV). Therefore, why not REALLY let the
customers decide instead of putting down a competitor's product? If you
also
want to hear the other side after reading Bill Henry's statement in
packet,
just check the Internet pages "http://www.scs-ptc.com". The latest
PTC-II
firmware can also be downloaded there for free.

Many items in Bill's proclamation represent his personal point of view
or
just contain speculations, and have thus nothing to do with objectivity.
Although it is entitled "SCS claims vs reality", there are several items
that can be proved to be wrong, in addition to its disreputable note.
Here
are just two examples:

Obviously, Bill Henry is not aware of the details on how PACTOR and
PACTOR-II really work (although HAL has implemented PACTOR-I in their
own
units; maybe that's why the performance of their implementation is so
poor):
The data compression can NEVER lead to an expansion of a file, as a full
PACTOR implementation always compares the original file size with the
compressed one, and if the "compressed" one is larger, as in case of
rare
characters when using the Huffman encoding, the original data is
automatically being sent. This means that the advantages of utilizing

any
other, more powerful compression can be used in the same way as with
CLOVER,
but CLOVER does not include ANY automatic data compression whereas
PACTOR
does. How do you want to apply an individual data compression when you
are
connected with a mailbox? And how will you make sure that the traffic
can be
monitored by a third party - which is not only a requirement of the
amateur
radio regulations but also most desirable when looking for a QSO partner
-
when utilizing an individual coding? Virtually all modems (including
phone
modems, etc.) nowadays include an on-line data compression, it is thus a
"must" for any up-to-date technology. How can it be an advantage not to
offer this feature? The on-line compression mode provided in PACTOR-I is
matched to plain text, which is transferred most frequently. It hence
already represents a basic standard for all systems. PACTOR-II even
includes
six different on-line compression methods in addition to the run-length
encoding, and automatically applies the most effective one.

A still more important item is the comparison of the simulator tests. To
justify their assertion that CLOVER provided a similar robustness as
PACTOR-II, HAL supposed that SCS had used 500 Hz bandwidth instead of
3000
Hz as they did, which would - according to HAL - lead to a better result
for
the SCS units. This shows that they have not even understood the very
basics, as in this case the results for PACTOR-II must have been much
worse!
If you spread the noise over 3000 Hz to disturb a signal with a
bandwidth of
500 Hz, the effect will of course be much less than if you concentrate
the
same noise power in the small bandwidth of the "target" signal. This
means
that, if SCS had actually done the tests in the way as Bill Henry
claims,
PACTOR-II would still work in conditions with an SNR down to minus 26 dB
when using 3000 Hz noise bandwidth rather than only down to minus 5 dB,
as
HAL concluded. This is a nice example of their "know how". How can these
guys seriously talk about any simulator measurements? As you can see in
their publications, SCS of course also did their simulator tests
according
to the CCIR standard. This means that you do can compare both
measurements,

and that PACTOR-II is really able to keep a link and transfer information in
conditions with an SNR down to minus 18 dB, whereas a CLOVER link already
breaks if the SNR falls behind minus 5 dB.

This message is not considered to be an assault on HAL. The intention was
just to correct some of their "facts". I have known this company for a long
time. They developed nice equipment already many years ago, and I still
consider them to be honest. Nevertheless, each digital operator has to
decide for himself which mode he prefers (and should be able to do so). On
the other hand, it is not my intention to prevent people (like me) from
telling their personal opinion. However, it is surely no good policy of a
company to put an affront upon a competitor in the international packet
radio network. Therefore, I hope that such "statements" will not happen
again.

I dont understand what the problem is,,, Yaesu will still work on your FT-1. I had mine updated to a Lot 10 not too long ago. The only other place I would send the FT-1 to for repairs is Burghardt Amateur Center at Watertown S.D. They have a complete repair facility in fact it may be the best in the U.S. and about 5 or 6 tech's working full time. Whats wrong with it?? Maybe you could fix it yourself, its a great radio with the best shift/width and excellent filters. The front end is crunch proof too with push pull rf stage and a double balanced diode ring fist mix. The agc is second to none. Unfortunatly it dosent have the all the bells and whistles which are required by hams today.

snip...

A reverse diode across the coil is important since it protects the coil
from the otherwise large counter EMF across the coil during break. (I
measured 450v peak across a 24v relay coil during break.) However, such a
diode increases the break-time. By placing a resistor in series with the
diode, the break-time can be cheaply decreased and the counter EMF held to
a reasonable amount. As a rule of thumb, the series R should be 2 to 3
times the coil R. More R =s faster break-time, but with the trade-off of
more counter EMF volts.

The make-time of a DC relay can be decreased by connecting the coil in
series with a resistor that has 3 to 5 times the resistance of the coil.
Naturally, this arrangement increases the voltage needed to operate the
relay. For example, a relay has a 240 ohm coil rated at 24v. A 720 ohm
resistor is connected in series with the coil. In order to produce 24v
across the coil, 96v must be applied to the series coil/resistor. This
circuit is recommended by Jennings, the company that manufacturers
vacuum-relays.
Here's how it works: Relay coils have inductance. For instance, the
Jennings RJ-1A's 26v coil has about 0.3H. It takes time to overcome the
inductance and build up a flow of current before a relay can close. The
circuit described temporarily provides more coil voltage at make, thereby
shorting the time it takes for current to build up in the coil. I
measured a make-time decrease of roughly 65% with the circuit described.

The use of the high voltage FET or bipolar transistor keying buffer is a better solution, and is quite acceptable from an engineering standpoint.

I think the other person suggesting that was more on target.

Cross-posted to: rec.radio.amateur.digital.misc,tnn.comm.pager

Hello All,
I've cleared the hurdles of a) getting the 'pd203' program
configured and b) building an interface. Having done that, I'm now left
with either scrolling screens of data real time or big log files to look
through after work :-(

Does anybody know of any sort of 'management' program to handle this
data? I was thinking of a customizable 'favourite pager' logger or
'bleep when the word xxxx appears in any message' type of thing.

Thanks,

Eric.

Check out http://hydra.carleton.ca/articles/hispeed.html

In short you don't want a TNC; you need a PI2 ISA board, a DSY modem
for it, and a transverter.

That oughtta work.

For the mods, my preference is
http://www.gag.com/hamradio/mitrek.html

The others are more invasive and one or two involve tweaking the IF
response, which is an improvement but not absolutely necessary.

To get the Mitrek on your chosen frequency in the first place you'll
need a manual from Motorola (for the tuneup procedure, connector pinouts
etc). They are still available as reprints from an 800 number I don't
have handy at the moment. Also a key to open up the radio, which you can
get at the same place as the manual. You'll also need receive and transmit
crystals, channel elements to put them in, a dummy load, an analog VOM,
a counter is kinda handy, a nice RF signal generator with FM capabilities
is even more handy, etc. After you get it working on the right
frequency the mod is trivial by comparison.

I mounted my radio in a rack-mount case with controls to duplicate those on the control head, and a DIN in back to hook up to the TNC. Gold-plated RS-232 socket inserts (the kind you use in a female d-sub connector) covered with shrink tubing make really nice connectors to go on the small pins on the Mitrek's head connector; plain bullet connector sockets work for the big pins. You could just use the female head connector but I didn't want to waste mine in case I ever needed it for testing the radio as a voice radio.

Mine has been on continuously for a year or so and I haven't had any problems. TxD is set to 40ms.

1350. MSK Demod/decoder for ACARS?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-25 00:00:00 UTC
From: kwick@mitre.org
Message-ID: <kwick-2502971552480001@cronin-2ci.mitre.org>
Source record: 31353

I want to count parity errors in ACARS messages. The AEA and other inexpensive zero-crossing-counter-plus-software packages for decoding ACARS MSK messages strip off the parity bit before sending received characters to log files, so there's apparently no way to do off-line parity-error counting. Anybody know of inexpensive hardware/software that delivers a stream of 8-bit ACARS characters to PC input? kwick@mitre.org

There are several sources of modification information on the 'net. Don't have them handy at the moment. But I agree the Mitrek is about the best dedicated packet radio one can buy. Its amateur friendly. Built like a brick. Working radios sell from $20 to $50. Make sure you get channel elements, otherwise they will cost $3 to $25 each. Also strongly suggest you insist on getting the proper Mitrek cable assembly plug.

Make sure you get a Motrola manual too. You can buy it direct from a Motorola 800 number for $15, delivered. Might want to buy a manual before buying a Mitrek so you know how to read the P/N's. Don't think you'd be happy with a 470-490 Mhz Mitrek.

As for modification, some insist the IF filters don't need to be changed. I differ. Unmodified most of my radios show visible distortion on a 1kHz sine wave with 2.5 to 3 kHz deviation. Wider IF filters are available from DigiKey at $2.50 or $3.00 each. You need 4 per radio.

I pull the pre-emphasis caps out of the mic circuit and change the gain resistors in order to drive the TX channel element with about 1v p-p from the TNC. Others bypass this circuit entirely and drive it with 5v to 7v p-p direct from the TNC. G3RUH modems can drive this level. Others can't. And my Icom IC820H wants 1v p-p, so that's been my standard.

The neat thing about Mitreks is the points you want to tap for RX and TX for 9600 are on the external connector. And the radio tunes with a voltmeter and wattmeter. Frequency counters are helpfull. So is an amp meter on your PS.

There is also a single resistor you can change on the RX side to adjust the RX voltage. In about the same place is a capacitor that many recomment removing.

About the only weakness I've seen in my Mitreks is that my 2m 40W radio used to be senitive to electrical storms. Sensitive in a way I never expected. The 2N3904/2N3906 pair used in PTT input get

clobbered. And the radio keys until you notice. Spent many hours studying the circuit with a DSO. Don't like some of the overshoot and ringing I've seen. But the second time I replaced these transistors I slipped a couple of 1N4148's in to see if that helped. Couldn't tell on the DSO but the radio has run about a year now without failure.

The mosfet will harmlessly break down well before that. Just note that
some mosfets do weird things at breakdown, like oscillating for a moment
at several MHz. Don't use those ones ;)

>--
>--Rich-- ag6k, 805-386-3734

The technique works *VERY* well. I've been using a T/R switch for QSK
that uses an RJ-1A driven this way for 22 years now. My plate voltage
switch has a Cramer hour meter on it that had over 10000 hours of plate-on
all-cw time for my hand built pair of 4-400a's that goes through this relay,
before the first one got to dragging. I bought two back in 1974, one for a
spare, thinking I would use in a year or so....

Surprise, the first one went over 20 years of *HARD* use, --- I gave up
even *THINKING* about the zero's in the number of operations when I
got to trying to figure that out for all those hours since my plate voltage
isn't brought up unless I need the stuff.... Yeah I know, how much do
you really send in an hour, but, pileups are pileups etc... :)

Of course I don't switch it hot, but it follows stuff nicely up past 60 WPM
in this sort of arrangement. I couldn't say enough good words about Jennings
stuff, besides which the pair of vaccuum variables in the amp are also
Jennings. These relays are available through Davilyn, Corp. out in California
as well as Nebraska Surplus. If you get them, be sure and get the new ones.
Even at $100 or so each they are worth it. The reason is that pulls are
also available, but you really have no way of knowing if the pulls have been
subjected to abuse.

There are certain products that just catch your eye for craftsmanship. BMW
cycles, Beech aircraft pruducts... the knid of things that you just can't seem
to put down without looking at them first or looking back at it as you walk
away from it...

These little jewels are a tiny example of that kind of stuff...

Packet Radio with 8051 Microcontroller

PRKISS51: is a AX.25-KISS-Interface. It allows you to write your own packet radio applications. Example source code PREXP 0.1 included. PRKISS51 0.4b 961022 (31 kBytes) noenglish

Also UU9JDR have made a KISS TNC, but source not avaible and no english DOC yet.

IMHO KISS_only TNC based on microcontroller not so interesting. You can use more simple Baycom modem, new PICPAR modem by DF9IC, Sound Card. Good if TNC can working as: TheNet Node, etc NODE, Host mode, PMS.

Good insights but why still play the role of a victim? To be liberated
from your past, you have to LET IT GO. Ten years from now, you'll hate
who you are today. There is no peace or healing going on when you
despise anything, past, present, or future. Its all INSIDE you - what
isn't there to love?

Peace and healing come with acceptance and forgiveness. Then you can love
instead of hate. Much better use of energy. In fact, the sensation is
that it takes no energy. What we resist (the pain of not loving) persists.

1365. HELP: FT-8000R and 9K6 PACKET

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-26 00:00:00 UTC
From: quandt.pad@sni.de
Message-ID: <5f16qb$m75@linus.pdb.sni.de>
Source record: 31219

Hello,

some weeks ago i bought a FT-8000R and like to use it in packet radio.
1K2 packet is working very well, but 9K6 (G3RUH modem) does not.
The main problem is on the RX-Side, the TX is ok. I have found,
that the higher frequency parts of the AF is limited by a R-C seriell
combination (100k / 1uf) at pin 9 of the FM-Demodulator (UHF) circuit.
Many other users here in Germany have the same problem.

Some users have connected a 33nF capacitor in parallel of R2211 (100k)
and 9K6 works much better.

Is there any other solution available ?
YAESU in Germany has no idea.

Guys, this has been a really interesting thread and I've learned a lot
reading it but there's one thing I'm not clear on and that's what's
meant by the term "Gaussian Noise Distribution"...is this referring to
what is basically random or pseudo-random noise, white noise, pink noise
or something else entirely?

Please pardon my asking but I'd really appreciate an explanation on this
in as basic terms as possible (without over-simplifying).

Thanks,

> > >
>

Another proven way to speed up relay drop-out is to use a zener diode in series with a regular diode across the relay coil. The cathodes of both are tied together and the anode of the zener goes to the positive terminal of the coil and the anode of the regular diode to the negative terminal. For a 12 volt coil, a 20v zener is suitable. This arrangement will clamp the peak reverse spike to 21 volts or so.

I have used this technique on a Mocom 70 which measured 65 ms drop-out when using a regular diode spike suppressor and it was reduced to 15 ms (same as the pull-in time) with the above mentioned circuit.

A MOV surge suppressor of suitable ratings (18v or so) should also do the same job at somewhat higher cost.

People,
You are missing the point! The object of newsgroups is the free exchange of ideas and information, just like ham radio is supposed to be enjoyed. Not by ignoring peoples views just because you don't agree with them. That is what makes the United States of America GREAT!
Not censorship!
You don't like don't logon or turn off your radio.

>It is your right to pass or not pass as you see fit. In general I agree
>with you Burt looks much worse for his posts. However if a sysop
>chooses not to pass anti ham propaganda that too is his right. After

Correct. I agree with and support this right. However, just because
you have a "right" does not mean you have to exercise it. After all,
you have a "right" to make a fool of yourself, too. Remember, power
corrupts, and once you start censoring what goes through your BBS,
you'll find all sorts of excuses to filter out anything that annoys
you.

>all you guys supply the time, equipment, location and expertise we all
>enjoy thus it is your foot ball and you make the rules. Most reasonable
>people would accept this but then Burt is not reasonable.

And if all the Sysops who find various things unreasonable start
killing them, the network collapses. If you don't want to be part of
a free-flowing information net, then you have no business setting up a
BBS on such a net. Put your little up-tight closed BBS off on some
peripheral channel, and lock out folks to your heart's content.

I repeat: It's legal to lock out folks like Burt (or me - it's
happened more than once) but it's not ethical, nor is it in the spirit
of Amateur Radio. It's hard to overemphasize the importance of this
principle.

Hint: How far do you think the Internet would have grown if it
catered to the same sort of censorship that some hams practice?

I use Netscape and it's newsreader. Is there anyway that I can filter
out certain subjects/individuals from having them show up in my reader.
If not can you reccomend a news reader that has this facility.

I am not denying individual's right to blow hot air. As far as I am
concerned, their argument is lost at the outset by posting it to an
inappropriate news group anyway. This last posting reminds me of "Oh you
are so good at milking cows. I wish I could do it as well as you do."
The only problem is someone doesn't know a cow from an ass.

Thank you for your help with ther news reader.

Sounds like you have the U.S. Post Office and ham radio confused.
The big problem with the packet network is sysops who don't pay
attention, forward anything to anywhere, loose mail by letting things
sit on their system forever, etc. Running a BBS is something that
requires a) time and b) effort, and too many packet BBS's consist
of a TNC, a radio, a computer with BBS software that somebody's
buddy set up, and a ham running around patting himself on the back
calling himself a 'sysop'.

>If you're not part of an open network, you're just cluttering up
>valuable space on the bands, and are giving jerks like Burt more
>ammunition.

I think you have that backwards, too. I don't know who the first two hams were who hooked up TNC's and BBS software, but I imagine that the intent of the first link of the 'packet network' was to forward information, not garbage. Keeping the network free of garbage reserves valuable space for valid information to be passed.

The amateur packet radio network already forwards, by design, an incredible amount of garbage in the form of message headers. I don't recall the exact figure, but a few years ago I analyzed a months worth of ALLUS bulletins, and I think that headers accounted for between 40 and 50 percent of the total character count. Add to that garbage a totally unnecessary ASCII drawing at the end of every message, a few lines of advertising from the guy who wrote the whiz bang terminal program used to generate the message, and top it off with an ACK at the end so the receiving system generates a totally unnecessary return message saying the mail got there, and you run the percentage of garbage up well over 50%. The packet network does a wonderful job of diseminating garbage, but unfortunaly falls flat on it's face when it comes to delivering mail from one ham to another ham.

I agree one hundred percent with Steve. I supplied the two computers, three radios, three TNC's, assorted power supplies, cables, antennas, etc. that are used to run my packet BBS and DX cluster. I pay the electric bill every month. When the little red transmit light on one of my packet radios turns on, I decided what gets transmitted, and it damn sure won't be Bubble Head's Bible Quotes or daily birthday lists from the Happy Club. Steve chooses to keep certain people off his system. I choose to keep certain garbage off my system. We are both doing what we are supposed to be doing, monitoring and eliminating garbage.

My packet equipment isn't a 'public service'. It's a service provided for hams to use in relation to ham radio. Bible banging and birthday lists have nothing to do with ham radio, so I make the decision to keep that junk off my system, and not contribute to the confusion by sending it to other systems.

When you, TAPR, or the ARRL decide you would like to reimburse me for the cost of my equipment and start sending me a paycheck, I will be happy to revert to your system of not excluding anything from my BBS.

By the way, Burt's messages pass freely thru my BBS, as his topic of discussion always seems to be ham radio related.

WHY is it that the power-monger, ol'-boy repeater coordination groups INSIST on screwing the digital community every time. Not ONE single repeater pair for digital application in this whole plan. Is it ignorance, or just an unwillingness to give up ol'-buddy-Joe's talking-beeping voice machine. Hell, even the 1970 ARRL plan allocated 146.82 as a digital repeater freq! Seems to me the local coordination groups are making negative progress.

On the other hand, who needs them. There is nothing that would prevent folks from running packet through the local bent-pipe voice repeater. Give it a try! If nothing else you'll be sure to generate some activity!

You may also need to include a resistor (2.2k?) to key the HTX.

Be sure NOT to cover the fan holes. And if you can look for a "CE" or "CU"
approved sheilding. This is the new "European Community(or whatever it is
called standard)" it is MUCH tougher to pass than current weak FCC
standards.
The company I work for builds industrial computers and it took over 18
months to get ONE line of out computers to pass!
You can also find (maybe) a ferrite paint. Simply, it is paint with iron
fillings in it. It is used alot in the US military, so it is expensive.
Also check to see if your household ground is okay, if there is too much
resistance, stray noise has to go somewhere!

Hams are so brave with insults, from a distance.
I receive many packet messages of support, would you like to see some?
I figured hams could not think fast enough to engage me in a live
discussion,
so far after years on here I have been unable to get on on the air with
one to do so.

I will easily win any discussion because I have the facts and I engage
students saily, they are far more challenging than most any ham could
be.

Hah, Haaaaaa, Hah, Haaaaaa, Harrrr, Harrr

Oh Sorry.

Would this be NT-4.0 with an open Ring 0 or the safe NT-3.5x
I really dont know if a device driver exist but you might try your hand at converting the Linux code over. I mean, NT is POSIX right (snicker)

If you are using a TNC you should be able right your own code for the rest, no device drivers needed.

I really should not be laughing, I have to implement a 20 Station Unix to a NT-4.0 / Unixware Hybid. Yiks!!!!

Seriously, much luck and 73's. Keep me posted on the project, I am interested.

Browsing through a CD-ROM of amateur radio s/ware I saw a "chess over packet" program.

Have you seen any software which would allow a group game such as a MUD to be played over a packet system ?

A few years ago there was a Pyroto (?) game for a BBS but I think it was based on multiple telephone modems.

Eric,

There is a program called P-Base, which is designed to work with the pd203 decoder. With it, you can sort and search the log by pager number, time or content. It is shareware and can be downloaded at http://www.devans.demon.co.uk/p_base.htm .

MSK stands for Minimum Shift Keying. In MSK the frequency shift
is chosen to be the smallest value which makes the mark and space
channels orthogonal over the symbol (bit) period.

Some friends and I discussed playing chess using an APRS system. Just create a map in your APRS software that looks like a chess board. Or better yet, use a map of your town (knight to main and third st. <G>) I can't remember the technical details, but it should be feasible.

>Have you seen any software which would allow a group game such as a MUD to

Well, my room mate once ran a MUD on his linux/TNOS system, and that seemed to work OK. It also offers quite a few other options as well.

I don't know, but I've been told:

Older crystal controlled radios (which typically cost less) can be easily converted for 9600 Baud Packet use.

If you could provide info on which radio(s) you have successfully modified and how it was done I would greatly appreciate it.

Please E-mail N9TZY@aol.com

>I assume there ARE modifications that can be done to the radio?
>What do the mods actually do? clean up input/output audio?
>new to 9600---

The Maxar is easy to set up. Don't modify anything. Take
the demodulator output from the IF IC, I believe pin 6. Feed
the modulation audio to the top of the modulation level trimpot,
which is after the pre-emphasis network. I removed the emitter
follower transistor directly adjacent to the trimpot to avoid
loading the modem down.

It can't be stressed highly enough that 9600 baud requires
"flat" audio in and out - no pre-emphasis or de-emphasis.

Do you have the service manual for the radios? It may still
be available from Motorola, and you *really* should have it.

Hi Bart:

Does that mean the shift is dynamic, that is, changing depending on
signal conditions, or is it fixed at a certain shift? What is that
shift? What's the baud rate?

If the shift is fixed, you could probably use the PK-232 in ASCII mode
to do the basic detection and possible demodulation if the code is
ASCII and it's a standard baud rate, say 1200 or 600 or such...

Thanks.

The program can easily change the callsigns by using the
configuration manager utility. The logbook is kept in one data file however
and is not changed for each callsign. Interesting idea though...

A popular quote used on the ham bands when faced with malicious QRM and vocal vandals, is "don't feed the animals". With that view in mind, this will be my last post on THIS subject. I really don't expect to see any logical debate flowing from the likes of burt, who could EASILY sail around the world in his own wind powered sailboat - but regardless of my own personal failings, I have YET felt the lonliness and need to advertise on Internet in an effort to find someone who will talk to me on the radio. Party on, Burt dude....

This would be extremely easy to do if running TCP/IP via packet. On a *nix
box, this should be do-able "out of the box"...

I'm looking fo a way to decode the data broadcast within the FM broadcast stations.
I can get the data using a Ramsey SCA decoder, I need an interface to the computer and some type of software.
Can anyone offer a suggestion?

Thanks,
Bill Heacock

I imagine you could find at least one of them right here in this
newsgroup, or at least one or more of the first small group.

>imagine that the intent of the first link of the 'packet network' was
>to forward information, not garbage. Keeping the network free of
>garbage reserves valuable space for valid information to be passed.

Nonsense. One man's trash is another man's treasure. Who appointed
you arbiter of what's garbage and what's not?

>The amateur packet radio network already forwards, by design, an
>incredible amount of garbage in the form of message headers. I

At one time, those were mandatory. They still contain an amazing
amount of information essential to maintaining and troubleshooting a
network. Yes, they could be streamlined. So could a lot of other
things.

>that garbage a totally unnecessary ASCII drawing at the end of
>every message, a few lines of advertising from the guy who wrote
>the whiz bang terminal program used to generate the message, and

Yes, those are wasteful. But that's a separate issue, unless you
decide that you aren't going to forward anything by anyone who uses
ASCII in his signature.

>network does a wonderful job of diseminating garbage, but unfortunaly
>falls flat on it's face when it comes to delivering mail from one ham to
>another ham.

That's why we have the Post Office and the telephone. Of course, if
sysops were doing their job instead of worrying about censorship and
power trips, it'd work a lot better. In fact, it DID work better
several years ago than it does now.

>I agree one hundred percent with Steve. I supplied the two computers,

>the Happy Club. Steve chooses to keep certain people off his system.
>I choose to keep certain garbage off my system. We are both doing
>what we are supposed to be doing, monitoring and eliminating garbage.

You're both part of the problem, not part of the solution. You have
no business setting yourselves up as arbiters of what's garbage and
what isn't. If everybody did that, there'd BE no packet network. If
you want a closed net, be my guest. Forward to *each other*, sans
"garbage." But don't pretend to be part of an open, global BBS
network, because that is NOT in the spirit of Amateur Radio.

>My packet equipment isn't a 'public service'. It's a service provided for
>hams to use in relation to ham radio. Bible banging and birthday lists

No, it's an ego trip that allows you to force your decisions of what's
"right" or "wrong" on your fellow hams.

>have nothing to do with ham radio, so I make the decision to keep that
>junk off my system, and not contribute to the confusion by sending it
>to other systems.

You're a disgrace to good sysops everywhere.

>When you, TAPR, or the ARRL decide you would like to reimburse me for
>the cost of my equipment and start sending me a paycheck, I will be
>happy to revert to your system of not excluding anything from my BBS.

When folks like Burt get their way, thanks in large part to attitudes
like yours, I hope you'll be very happy with your commercial station.
Of course, if you had to compete with commercial stations, you'd be
out of business in a week, since the real world has little tolerance
for censorship and ego trips.

Hello folks,

First I want to thank you all for answering my previous faq's regarding ham-related rules and regulations. Here you have another part of them:

Now I want to know if there are some written rules for "digital" hams, i.e. folks working on packet, amtor etc. I wonder if...

1. Your authorities have right to asign some "special" callsigns to the stations that are working as bbs's or nodes.

2. You have to use these asigned callsigns, even if you have your licence
with your own call.

3. Your authorities might forbid your node/bbs activity if you are not likely to accept the callsign asigned.

4. Your node/bbs callsign and alias have to remind users to the city/town
(or anything else) where the system is working from.

5. Your are required from the authorities (or anybody else) to use H-address
*.EURO instead of *.EU or vice versa.

6. There is some commision to monitor users' activities regarding rules above. This commision makes or changes rules that all others have to accept, even if they do not like them.

Pse respond before March 15th when our "rules" will be brought.

The comparisons were with the "slow" CLOVER controller (P-38) instead
of the "fast" controller (PCI-4000 or DSP-4100). With the "slow"
controller,
the top CLOVER data rate is limited to 1/2 of that obtainable with the
"fast" controllers. All tests I've seen to date give PACTOR-II an edge
under poor S/N and under rapidly changing conditions, and give CLOVER
the
edge under good conditions. Other than at these extremes, the two
protocols
perform very similarly.

Hardly true at all yet. Most of those systems are still on CLOVER.
The cost of the PACTOR-II controller, compared to only moderate
improvement
in overall data rate in realistic forwarding situations has convinced
many
of us not to bother making the investment. Perhaps when the cost of the
PACTOR-II controller drops a bit ...

> Here
> are just two examples:

The use of data compression benefits both protocols equally, and in
exactly the same manner. Having compression "built into the controller"
can be a big lose, since the application might well choose a more
powerful
compression scheme. So to make reasonable comparisons between the two
controllers (PACTOR-II and CLOVER) you need to compare ONLY the raw data
rates, under similar conditions. This is the comparison which shows
PACTOR-II
better in low S/N situations, and CLOVER better in high S/N situations.

Note that the majority of BBS forwarding is done in high S/N situations;
at the small data rates available from either controller under low S/N,
it is not possible to move enough data to be "interesting."

> includes
> six different on-line compression methods in addition to the run-length
> encoding, and automatically applies the most effective one.

The advantage of "not offering" the feature is obvious: the application
has the choice of using whatever compression scheme it wishes, and it
not
limited to what is hard-wired into the controller. In the case of BBS
forwarding, it is ONLY the stations running WinLink which do not use
compression.

> already
> breaks if the SNR falls behind minus 5 dB.

This is the situation where PACTOR-II performs better than CLOVER.
At the other end of the S/N chart, CLOVER will outperform PACTOR-II
by somewhere between 10% and 50% or more. The data published to date
is unclear on the margin, and was obtained using the P-38 controller
(which is limited to 50% of the maximum CLOVER data rate.)

It would be very nice to see some results from better controlled tests,
covering the full span of capability of both controllers.

The other important issue which has not been addressed in any report
I have seen is the performance of either controller under different
types of propagation. PACTOR-II should adapt more rapidly to changing
conditions, and should have an edge over CLOVER at any signalling rate
under these conditions. The region of interest here is propagation
which varies on a few second to several tens of seconds span. Very
common situation for paths with multiple ionospheric modes.

Both SCS and HAL claimed a 4 kHz noise bandwidth for the tests which
measured data rate vs. S/N. In my mind this is equally misleading on
both sides ...

I won't comment on the matter of "who is right" and "who is wrong".

No matter which company has behaved better or worse, we simply do not
have enough information to know which controller will work better under
what circumstances. The solution to this "problem" is simple I guess:
purchase both controllers and do the experiments ourselves.

O. I C. The packet 'network' isn't for forwarding mail from one ham to another.
It's a digital soapbox for Bible Bangers and Birthday Clubs. Thanks for letting
me in on that secret. Next time I see someone put NTS traffic or a personal
message on the BBS here, I'll kill it and tell them to use the telephone.

You appear to be of the 'forward it anywhere and my job is done' mentality.
No wonder you'd rather forward bulletins than personal mail. ANYPLACE
is the right place to forward a bulletin. Personal mail requires a bit of
work .....

>Don't teach your grandmother to suck eggs. I've done all that stuff,
>and more.

Well, since you have already taught your grandmother to suck eggs,
I guess we can have her teach mine, but if you want your grandmother
to teach my grandmother to do anything, tell her to bring a shovel, cuz
she's gonna have to dig my grandmother up before she can start class.

>network, because that is NOT in the spirit of Amateur Radio.

There is no such thing as a global Amateur Radio BBS network. There
never has been, and there never will be. Unless, perhaps, if you define
'global' as a hundred miles in any direction of your house. Most of us
who don't live in the United States Of Drug Dealers use the word
'global' to mean the ENTIRE world, not just the little part that you live
in. If you have fooled yourself into thinking there is a 'global' packet
network, send me a packet message with your phone number in it and I'll call you
when it gets here: KH2D@KH2D.GUAM.USA.OC

Don't bother staying up late waiting for me to call.....

>>My packet equipment isn't a 'public service'. It's a service provided for
>>hams to use in relation to ham radio.

>No, it's an ego trip that allows you to force your decisions of what's
>"right" or "wrong" on your fellow hams.

Now I'm on an ego trip. OK. Didn't you just tell me "Don't teach your
grandmother to suck eggs. I've done all that stuff, and more. "

>When folks like Burt get their way, thanks in large part to attitudes
>like yours, I hope you'll be very happy with your commercial station.
>Of course, if you had to compete with commercial stations, you'd be
>out of business in a week, since the real world has little tolerance
>for censorship and ego trips.

You lost me a bit here, I'm not sure what 'Burt's Way' is, I thought this
discussion originated because you were upset with the fact that Burt's
mail was being kept off Steve's system. I'm not here to compete with
commercial stations. I'm here to enjoy ham radio. But you're right.
Nobody gets fired when the operator of an Amatuer Packet Radio BBS
runs around patting himself on the back yelling 'I'm a SYSOP ! I'm a SYSOP !"

while the mail is getting forwarded to La La Land. And judging from
the amount of mail that goes to La La Land, it's a good thing, because
a lot of 'sysops' would be out of a job.

I think we have found the problem here, Glen. You don't seem to have
a firm grasp of the definition of the word 'network'. Networks don't
collapse from lack of traffic, they just move the existing traffic much
faster.

1427. Wanted: Radio-Modems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-27 00:00:00 UTC
From: Galaxy Scientific <galavi2@acy.digex.net>
Message-ID: <01bc24c6$ec3ee280$0de9dd26@aviation.galaxyscientific.com>
Source record: 31281

I am looking for a radio modem- actually a *lot* of radio-modems-- about 100,000 of them. While I relize that what I'm looking for is somewhat different than your typical ham packet setup, it is related, and I'm hoping that some readers of this group might know of, or even be, a potential source for this device.

I'd like to emphasize that this is a real-live, large order- 100,000 - 500,000 units over a few years, with a bare minimum initial order of 10,000 units.

Preliminary specifications are below.

Any information would be greatly appreciated.

Ted Grant
tedgrant@earthlink.net

Description: Radio-modem, in OEM-board type format,
including RF section.

Data Rate: 2400 baud minimum
Modulation: negotiable
Frequency: 450 - 470 MHz (multiple frequency, 25 kHz channels)
Deviation: +/- 4.5 kHz
Range: 16 mi with line of sight,
Note: Antenna to be used will be something like a quarter wave dipole, but mounting restrictions mean SWR and effective output will less than ideal.

RECEIVER
Sensitivity: -110 dBm

TRANSMITTER
Transmit Power: 5 W [nominal. Other power OK if range requirements met]

Hi, hope this is not a FAQ...
I came across an RTTY modem that I've built 10 years ago for my C64
:-).
I have adapted its TTL out/in to RS-232, but now I miss a good
shareware program for the PC.
All the software that I've found expect one of the following :
a) - a TNC running at 1200 baud or more
b) - HamComm interface
Now for the question : there is a good RTTY software that support a
standard RS232
interface for and is not as old as TTY37 ?
Can anybody provide an FTP site ?

Regards,

Valerio IK0EAY

1431. Frequency Hopping Idea F/Am. Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-02-28 00:00:00 UTC
From: Kreblon@ccwf.cc.utexas.edu
Message-ID: <5f6vh3$d1n@geraldo.cc.utexas.edu>
Source record: 31285

Hello All-
I am as swept into SS technology as most of you info junkies are.
I had a thought last night...one of those twilight ideas.
How about devising a simple SS system for Hams that would make
use of Computer programmable rigs and did not require
time based synchronization
of the PN code or GPS clock referencing to get sync'd up?
Here is how it goes...

Generate the hopping code from a central micro-controller (even a "basic Stamp")
and send it in FSK from a central tower in conventional unmodified
RTTY style modulation. Have each user demodulate the FSK code sequence
and drive the digital I/O interface on their rigs with the demodulated
frequency controlling sequence (assuming the rigs all used the same
convention...like -everybody has Icoms...) Then- everybody is marching
to the central sequence and even if lost periodically, re-sync would
occour rapidly. The delay of the FSK sync signal might be a worry, but I think
if you put the pen to it, it would be no problem in the typical coverage
area of VHF work. The narrow band nature of the FSK signal would let it
out-perform the range of the audio based user's radios- insuring solid
frequency control.
Hmm...El Cheapo Frequency Hopping Spread Spectrum
Now- what rigs would lock-up quick enough over a 100khz or wider spread
to work with this scheme?

OK Guys- Tell me why I am all washed up!

Although the FCC probably has that right, it is not done.
No special callsigns.

>
> 2. You have to use these asigned callsigns, even if you have your
> licence
> with your own call.

No special callsigns.

> 3. Your authorities might forbid your node/bbs activity if you are not
> likely to accept the callsign asigned.

No special callsigns.

> 4. Your node/bbs callsign and alias have to remind users to the
> city/town
> (or anything else) where the system is working from.

No special callsigns. Most systems use an alias that gives
users some hint of the location of the system (e.g. WLINN:W0RLI-1
is located in West Linn, Oregon).

> 5. Your are required from the authorities (or anybody else) to use
> H-address
> *.EURO instead of *.EU or vice versa.

The authorities do not know that hierarchical location designators
exist, nor do they care. They are not part of any callsign.

> 6. There is some commision to monitor users' activities regarding rules
> above. This commision makes or changes rules that all others have to
> accept, even if they do not like them.

All the above issues are not addressed by the FCC. The license specifies what bands and modes may be used, but does not specify any details of *how* two stations involved in a QSO must talk with each other, beyond the requirement to identify transmissions with the callsigns of the stations in QSO.

Burt,

It's my opinion that you go looking for trouble. You know what they say
about looking for trouble? You find it every time!! Hee hee!

As far as feeling superior to most Amateurs. That's really nice!
I'm glad you feel that way.

I remember getting into it with you over on the Relaynet years ago. You
were giving me the gears for sending out a general message of thanks to
all that replied to one of my polls. At the time I didn't realize that
it meant so much to you. I still don't understand why!

I don't know what you are trying to prove. Your message isn't clear.
Who was it that said Communication without intelligence is pointless?

Cheers!

1441. Baycom + Hamcom problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-01 00:00:00 UTC
From: wblair@rmi.net
Message-ID: <3317abaa.53716@news.rmi.net>
Source record: 31295

I've recently purchased the Baycom modem for my Pentium system. Having followed all setup instructions for the Baycom and operational instructions for the Hamcomm software (latest version) that I downloaded, I still cannot receive anything but garbage using my Sony ICF-2010, even with very strong, noise-free CW and RTTY signals. With RTTY, I use the bit length display to determine the baud rate and the spectrum display to determine frequency shift. Even when the receiver and tuning settings are set to _very_ closely match the signal peaks on the spectrum display with the mark/space frequency markers, I get nothing but nonsensical text and CR's.

On CW, even with very strong and clear signals, I get garbage (strings containing mostly e's). No combination of volume control settings and tuning settings (both receiver and Hamcomm) help. What the heck is the problem here? Is the tuning _that_ tremendously sensitive that the combination of the 100Hz receiver tuning steps and the 15Hz (if I remember correctly) Hamcomm tuning steps aren't adequate? In the case of RTTY, I might be monitoring an encrypted or scrambled signal, but no cypher produces morse code that's a string of e's.

Any ideas or suggestions? Are there strong, reliable, unencrypted RTTY and morse stations that I can use to get this thing working? I bought it to receive telemetry from the Radio Sputnik series of Amsats. If I can't even decode S9 terrestrial signals, I'll never be able to decode the comparatively noisy RS-10/11/12/13/15 signals.

Want some exposure for your shareware HAM program? Want to have fame and ... uh, okay, mostly just fame ;) by having your program published on a HAM CD?!

I am in the process of compiling HAM programs for publication on a HAM CD. If you have any program, shareware, freeware, or whatever, I would like to add it to my collection. I will try to make all of what I collect available on an inexpensive CD, so send me email on what you got! (But please, I can only publish it if you have the rights and give me the permission. NO commercial software -- I'm not a pirate!)

(You may also send me email if you might be interested in purchasing a CD after I have finished collecting programs and start producing CD's.)

Thank you for your time.
Darvell (N7LN)

(PS I am also collecting HAM Radio clip art for publication on CD. Send me what ya got.)

Hi all.

First, let me say that I have asked these same questions on the TNOS mailing lists, but have gotten exactly 0 responses back.

I'm working on switching from an MSYS BBS running on DOS to TNOS on Linux. I've tried TNOS 2.02 and 2.21. I have a working configuration for 2.02, but never got forwarding set up. When I take the autoexec.nos file from 2.02 and use it in 2.21 I get lots of errors. Some of these I've tracked down to changes in the command structure of the new version, but some have me stumped. If I use the supplied autoexec.nos with 2.21, I get mostly the same errors. It seems to me that the sample autoexec.nos was never changed when TNOS commands were changed.

Also, I need to get the forwarding set up. I have 2.02 running on my personal system (in my dorm room here at school) and it seems to try to forward to the club station. I was in the shack one day when I saw my callsign appear on the MSYS console as checked into the BBS. So, it apparently tries to forward, but nothing comes across. I've tried sending mail to a 3rd party @W8YY (the club station), but TNOS complains about unknown routing. I've attached a copy of the error message:

:

I've been playing around for a while since I posted this, and
I think I may have found a problem.

In the autoexec.nos file, the command
forward haddress #upmi.mi.us.noam
returns an error that this is an invalid haddress. The continent
must be 4 characters. As you can see, it already is 4 characters.

The sample autoexec.nos had a similar command, except is started
with mbox (or pbbs for the newer versions). This command also
caused the same error.

Thanks again,
Matthew

Seeing a bunch of E's and T's while trying to decode CW indicates that the rate is set too high. Try turning the auto rate function off and lowering the WPM setting. Although I am using a different modem/setup, I have found it difficult to copy code unless it is machine-generated. Try the W1AW broadcasts from ARRL - these are machine-keyed. You can find the schedule at http://www.arrl.org under W1AW.

I have found that most RTTY on SW is either non-standard or encrypted. Again, you can copy the RTTY transmissions from W1AW. Alternatively, one station that comes in clearly with unencrypted RTTY during the day for me (in the Midwest) is on 12.835MHz broadcasting weather information. Much of this information is using abbreviations, but you should be able to tell that you are not copying garbage (and they do send full text products from time to time as well). If you live near a coast, you can try copying NAVTEX (same as AMTOR FEC) on longwave 518KHz (usually transmitted every four hours).

Tuning should not be critical. What is critical, though, is to set the shift between low and high tones, as well as the baud rate, correctly on the decoder. Most ham transmissions use 170Hz shift, 45 baud, whereas commercial and military (including the weather station above) tend to use 850Hz shift with 75 baud. NAVTEX uses 170Hz shift, 100 baud. Also try the reverse keying option if you are seeing all garbage (or else tune in the other sideband).

Hope this helps.

1449. FT-50 w/ MFJ packet cable

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-01 00:00:00 UTC
From: timw@juno.COM
Message-ID: <19970304.150719.5351.2.TimW@juno.com>
Source record: 31303

Hello all:
I recently bought an MFJ ready-made TNC<-->Radio cable for my FT-50. I have the splitter, made by Yaesu, that splits the single four-conductor receptable into a "standard" two-jack setup. At the HRO store in Tigard, I tested it with a Yaesu speaker-mic from my friend's radio: It worked fine. However, when I plugged in the adapter, and the cable from the KPC-3 into the adapter, nothing happened. The TNC showed it was transmitting, and the radio would not transmit. Then, suddenly, the radio would "dead-key" I had to shut it off and remove the cable. Then, it dawned on me that perhaps there were incorrect component values in the cable for the radio (Yaesu requires a 2 kOhm resistor and a 40 uF capacitor). I opened up the connector shell, and sure enough. The component values were incorrect. Thinking I had found the problem, I went down to Radio Shack (gasp!) and promptly learned that they had no 2k resistors in stock. Remembering the information from my radio test, I bought a pack of 1k resistors. I also purchased a 40 uF electrolytic capacitor. When I got home, I desoldered the affected parts, and replaced them, soldering the resistors in series. However, it still doesn't work. ANY SUGGESTIONS? Please reply via private e-mail as not to take up space on the list.

Hi All,
We would like to establish a packet internet gateway at Yale University.
Your advice on any of the following subjects would be greatly appreciated.
digipeater manufacturers
TCP/IP on the air versus X.25-to-TCP/IP hosts
small dual channel radios and TNCs for laptops
software for any of this

Assume I know nothing, because I probably don't. I'd love to hear any
advice you might have. Thanks.

Although the AVT hardware was discontinued by AEA several
years ago, software updates were (are?) still available
from the original developer, Black Belt Systems.

Take a look at -

http://www.ultranet.com/~sstv/computer.html

There you will find information on various computer-based
SSTV systems including the AVT system and a link to
additional information from Black Belt Systems.

A company called " Black Box " in either Idaho or Montana built that
product, and sold rights to AEA. I suspect they may be still around.

Hello All, I'm setting up a F6FBB BBS with 2m, 220 and 20 meter access.
Anyway what is the best
300 baud packet 20 meter frequency for BBS access (no forwarding) and
keyboard to keyboard contacts.

Hello Everybody,
Can I operate packet with a Sharp OZ-6500 Wizard? This is a 512 KB
electronic organizer, and aparantly it can be put in a telcom mode
since it can send and receive faxes.
If so, can somebody please send me more information? Thanks!

...snip...
Fair Radio Sales currently has virtually new Jennings RJ-1As--for $35
each--that are removed from new equipment that was never placed in service.
Although Fair Radio Sales does not check these relays for gas with a high
potential tester, the price is right. If a relay proves to be gassy, Fair
Radio will make it right.
The minimum rated breakdown potential across the open contacts on a
RJ-1A is 3500VDC. A gassy output relay can destroy a good input reed relay
in an amplifier. IMO, it is abundantly risky NOT to test a vacuum
component before placing it in service.

I have tested new, out of the box, Jennings vacuum components that were in
storage for a few years, that had less than half of the rated voltage
withstanding capability. Obviously, pico-scopic seal leaks may go
undetected at the time of manufacture.

At break, the reverse EMF across the RJ-1A's 26v, 0.3H, coil can exceed
450 peak V. Although there are 600V-rated power FETs than handle this much
voltage, a NEEDLESS, recurrent 450v spike across a 24v relay coil is
hardly good engineering practice. A diode and series resistor (or zener)
should be connected across the coil to set the release time as needed (by
adjusting R) and limit the reverse EMF at break.

...snip...

Fair Radio Sales currently has virtually new Jennings RJ-1As--for $35
each--that are removed from new equipment that was never placed in service.
Although Fair Radio Sales does not check these relays for gas with a high
potential tester, the price is right. If a relay proves to be gassy, Fair
Radio will do the fair thing. The minimum rated breakdown potential
across the open contacts on a RJ-1A is 3500VDC.

A gassy RF output relay can destroy an RF input reed-relay
in an amplifier. IMO, it is abundantly risky NOT to test a vacuum
component before placing it in service.

I have tested new, out of the box, vacuum components that were in
storage for a few years, that had less than half of the rated voltage
withstanding capability. Obviously, pico-scopic seal leaks may go
undetected at the time of manufacture.

At break, the reverse EMF spike across the RJ-1A's 26v, 0.3H, coil can exceed
450 peak V. Although there are 600V-rated power FETs that can probably
handle this much voltage, a NEEDLESS, recurrent 450v spike across a 24v
relay coil is

hardly good engineering practice. IMO, a diode and series resistor (or zener) should be connected across the coil to set the release time as needed (by adjusting R), AND put a limit on the reverse EMF spike at break.

>characters to log files, so there's apparently no way to do off-line
>parity-error counting. Anybody know of inexpensive hardware/software that
>delivers a stream of 8-bit ACARS characters to PC input? kwick@mitre.org

i think i understand what you want but wouldn't know how to do it. ACARS uses
a strange encoding which toggles mark/space. There are no start or stop bits.
Once you miss a single transition all the rest of the msg is probably garbled.
Some errors may cancel out each other but it is just too easy to loose sync
with character boundaries.

Regards,
W.F.Schroeder

Sorry, wrong answer. While WF1B is a great RTTY program i doubt it will work
with an old C64 modem.

HamComm 3.1 works with any modem which delivers a mark/space signal.
Connect it to the CTS pin of COM port and select "External converter"
Reading the HamComm manual may also be helpful :-)

>Can anybody provide an FTP site ?

ftp.funet.fi /pub/ham/misc

The Baycom modem is for packet radio using the Baycom program.
The HamComm interface is for CW, RTTY, AMTOR using the HamComm program.

The Baycom program will not work with the HamComm interface.
The HamComm program will not work with the Baycom modem.

Can some kind soul point me to a site where are described the
RS-232 commands to control a Kenwood transceiver?

I've found several programs, but not even a single command description.

It seems to me that I saw something maybe in the operating instructions
for
the IF-10 interface kit to be used on the TS-440 transceiver.

Any help would be very appreciated...

Valerio

From: vincent@halcyon.com
Message-ID: <vincent-050397111836@blv-pm110-ip29.halcyon.com>
Source record: 31193

I am trying to set up my PK-88 with PC-Pakrat II as the communications program.In the operating manual only the PK-232 is mentioned however I was assured by the people at HRO that it wouyld work for the PK-88 also.I keep getting a link error program abort message. I have an internal modem in my PC and wonder if I am getting a conflict and if so, how to resolve it.When I was using the same PK-88 with my Mac I would have to unplug my printer port in order to use it. Is there way I can configure my IRQs so that the mouse and internal modem do not conflict.The Pakrat II is for Dos and I have windows 95 installed and go into the Dos prompt. Any help would be greAtly appreciated.
Yours truly;
Richard Vincent

Hello DSP-freaks

Does onyone know the algorithm for making an adaptive
multitone notchfilter on a DSP? Please e-mail me
information about a solution or where to find any
useable information.

Any special information to use on the ADSP2181
(EZ-KIT LITE)is appreciated but not a must...

yours faithfully

Bjarke

> > >> > a bad thing for packet.
> > >>snip> Lots of good stuff cut.

I was faced with this same problem and solved it in a slightly different way. I connected two transistors in series across twelve volts as though I was making a complementary output pair. Then I connected the relay from the connection between the two emitters and ground. With the two transistor bases connected together, the "output stage" was driven by another transistor. Thus when turned on, the top transistor passes current to the relay. When the pair is switched, the lower transistor passes the current that tries to continue to flow and produce a transistor destroying transient. Worked well for me, YMMV.

Best regards,

Art Borg

1492. Basic APRS Wx Equipment

Source record: 31196

I am just getting started in automatic APRS wx broadcasting. I am at the point of selecting equipment and I notice that Peet and Davis seem to be the two major vendors of computer-interfaced wx equipment.

Is one particular brand or model considered the "standard" or in other ways better than another? In essense, what should I buy?

Thanks for the help.

I still use Digicom (though rarely) on my C64 systems, still have a
portable system set up for remote operations running on solar and
automotive battery 12 VDC.
However, I use my own (DEVCOM) modems and not MFJ nor A&A.

From: hank <kb2rkx@soho.ios.com>
Message-ID: <331F74BF.176E@soho.ios.com>
Source record: 31107

Hi All

I'm new to packet and have a question. I've got a r/s HTX-202, a KPC-3 and a 286 laptop. Unfortunatly, I only have the Pacterm program that came with the KPC-3. Its driving me nuts because 1) it seems to disconect whenever the node is slow to respond, and 2) lines will go to fast to read and are lost. Is there a better program thats readily available? Thanks and thanks for putting up with this kind of basic question!

Hank, N1YDY

Hamcom will be held in the Arlington, Tx. Convention Center
from Friday, June 6 through Sunday, June 8, 1997. The
Texas Packet Radio Society (TPRS) http://www.tprs.org/ will
again host extensive programs on packet and digital subjects,
and has announced the program schedule and speakers.

In the past, these programs have been extremely well-attended,
so be sure to mark you calendar.

HAMCOM 97
TPRS Digital/Packet Program Schedule
Arlington, Tx. Convention Center

Saturday, June 7, 1997

9:00 - 9:30 Introduction to Digital Modes - Dave Wolf, WO5H
9:30 -10:30 Intro to Internet - Lee Ziegenhals, N5LYT
10:30-11:30 Spread Spectrum - Greg Jones, WD5IVD, Tom McDermott, N5EG
11:30-12:00 TEXNET update - Harry Ridenour, N0CCW
12:00-12:30 TPRS annual meeting
12:30- 1:00 break
1:00 - 2:00 APRS - Mike Heskett, WB5QLD
2:00 - 2:30 DXing with 2 Meter Packet - Presley Smith, N5VGC
2:30 - 3:00 Weather / NWS - Bob Morgan, WB5AOH
3:00 - 3:30 Radio Modifications - Joe Borovetz, WA5VMS
3:30 - 4:00 Channel Capacity - Tom McDermott, N5EG

Sunday, June 8, 1997

10:00- 10:30 Introduction to Digital Modes - Jim Neely, WA5LHS
10:30- 11:30 BBS forum - Dave Wolf, WO5H
